

CONSTRUCTION AND STANDARDIZATION
OF
AN ACHIEVEMENT TEST IN GENERAL SCIENCE
FOR HIGH SCHOOL I YEAR STUDENTS

BY

✓ G.M.KHAN GHORI, B.Sc., B.Ed.,

A THESIS

SUBMITTED FOR THE DEGREE OF MASTER OF EDUCATION

UNIVERSITY OF NISOUR.

DECLARATION

I 'do hereby declare that the thesis "Construction and Standardization of An Achievement Test in General Science For High School I Year Students" which I am submitting for the degree of Master of Education in the University of Mysore, is the result of an investigation - carried out by me under the guidance of Sri C. Rangachar, B.Sc., M.Ed.(Leeds), Principal, Teachers' College, Mysore..

Mysore.

10. 7. 61

Signature.

Rig. No. 201

ACKNOWLEDGEMENT

I was fortunate in having the expert and experienced guidance and supervision of -
Sri C. Rangachar, B.Sc., M.Ed.(Leeds),
Principal, Teachers' College, Mysore, who
is an eminent educationist.

I owe a very deep debt of gratitude to him.

I offer my thanks to Sri H.Venkataramaiah, B.Sc.,
B.T., M.Ed., Lecturer in Education, Teachers'
College, Mysore for his help and valuable
suggestions during the preparation of the
report.

I am grateful to the High School Teachers of
the various High Schools in the state for
their kind cooperation while conducting the
test.

CHAPTER I

INTRODUCTION

Science in the modern world.

"The civilization of a race is simply the sum total of its achievements in adjusting itself to its environment".¹ The nature and method of adjustment have been different at different times. We are living in a much more complicated and chaotic world than our ancestors. Science has revolutionized the material world in which we live. According to Whitehead "it has practically recoloured our mentality".² Thus every thing about us has been influenced by science. Our dress, our food, our home, transportation and communication have all undergone remarkable changes depending upon scientific discoveries and inventions. Due to the benefits of science the world seems highly shrunk. Man to-day regards this universe too narrow for his activities. He has been probing into the ether planets for greater comfort. The successful trip of Gagarin of Russia and Shepard of America in the outer space is ample proof of man's aspirations and abilities in understanding and overcoming the forces of nature with the help of science. Society must take advantage of such adventures and discoveries for the progress of the human race. "Science discoveries affect the every day lives of every one. Society must see how science must

1. H. S. Shih, "The Civilization of the East and the West", in "Whither Mankind", page 27.
2. "Science and the Modern World", page 3, by Alfred North Whitehead.

be used for the satisfaction of human wants"¹.

Pandit Nehru has aptly observed 'Science is now a new dimensional thinking for the solution of national and international problems. The future of the world lies not in the hands of the politicians but in the hands of Scientists and technologists'. Independent India wants men to outgrow their superstitious structure and develop a modern progressive scientific outlook to face the changing conditions of the universe due to atomic fission, radio activity and the sort in keeping with the advancements the western countries have been making in the field of science. It is not enough if there is a Raman for the whole country. Every Indian child must develop the reasoning pattern of Raman, imagination of Bose and the inquisitive nature of Ray, if India has to survive the struggle for knowledge and progress. Hence it is incumbent on the part of educators to see that children develop scientific interest and attitude right from the very beginning and do not waste their time in cramming some scientific information.

"In our schools and colleges, students tinker with a few test tubes and measurements, visualising of science as a laboratory issue. They are ignorant of wider implication in every day life and conduct. They are not being given scientific education at all, they are only

1. Laurence Magdon, "Science for the Citizen", George Allen Unwin Ltd., page 12.

learning a dull subject to pass an examination".¹

Meaning and scope of science.

We had so far a glimpse of the influence of science on the modern world. But then what is Science?

"Science is an inter-connected series of concepts and conceptual schemes that have developed as a result of experimentation and observation and are fruitful of further experimentation and observation. In this definition the emphasis is on the word 'fruitful'; Science is a speculative enterprise. The validity of a new idea and the significance of a new experimental finding are to be measured by the consequences - Consequences in terms of other ideas and other experiments. Thus concerned, science is not a quest for certainty. It is rather a quest which is successful to the degree it is continuing".²

Twiss summarizes the meaning of science as "knowledge so classified and organized that it may be used in acquiring other knowledges; that it implies not only content or subject matter classified and organized, but also a method of investigation or problem solving including observation and measurement, observation and logical inference - both inductive and deductive by means of which subject matter is organized and used in prediction, discovery and invention; that its subject matter is constantly growing

1. Saiyidin K.A., "Education, Culture and Social Order".

2. Bryant Conant, "Science and Common Sense", page 120.

in volume and being brought under simpler and more comprehensive forms of description; that all human material is legitimate material for its investigation; that it grows out of the problems related to human needs, physical, industrial, social emotional and intellectual; and that it is so intimately connected with industrial development that neither can go on without the other"¹ Thus we see that science is a continuous quest for systematised and organized knowledge. Science is not a collection of facts. According to Poincare² "Science is no more a collection of facts than a building is a collection of bricks. Science is man's relentless search for the understanding of the environment. It is a search by man by exploring, enquiring, seeking accurate description and explanation. The answers are tentative, inquiry continuous, always something more to be learnt. It is a search for classified understanding or interpretation of the environment. These interpretation become the body of science knowledge. They are the concepts, principles generalization which state our best present interpretation of our environment. The product of a scientific enquiry is a body of classified concepts."

Scientific Method.

The content and method of science have certain charac-

-
1. Hansen Twiss, "Principles of Teaching Science", page 10.
 2. "Journal of Science Education" Volume 45, February 1964, page 25.

teristics. The content of science consists, as mentioned above, of a continuously expanding body of systematized knowledge based upon scientific method. The method of arriving at knowledge in science is based upon certain principles. John Dewey opines "that the heart of science lies not in conclusions reached but in the methods of observation, experimentation and mathematical reasoning by which conclusions are reached".¹ Thus we may say that the conclusions reached must be according to a particular method which includes observation, experimentation and proper reasoning. That is to say, the student of science takes more pains than the man in the street does to get at the facts. He is not content with sporadic knowledge, but will have as large a body of facts as he can get; he summarizes the data, draws his inferences from them and sums up in a generalization or a formula. According to Bertrand Russell,² the essence of scientific method is the discovery of general laws through the study of particular facts. There are three stages in arriving at a scientific law (a) observation of scientific facts, (b) arriving at the hypothesis and (c) deducting generalizations which can be tested by observation or verification. In short scientific method is "Induction for deduction with a view to construction".³

Branches of Science.

Science has two major branches, pure sciences and applied sciences.

1. "Thirty-Seventh Year Book of the National Society for the Study of Education", Part II, page 431.
2. Bertrand Russell, "Science", in "Human Problems", page 43.
3. Quote quoted by Arthur Thomson in "Introduction to Science", page 40.

pure science aims at understanding nature whereas applied science deals with predicting and controlling it. Pure science has many branches - physical sciences, biological sciences, and earth sciences. This division is purely intellectual. Science does not exist in nature on this compartmental basis. "The division of sciences are not like the different lines that meet in an angle but rather like the branches of trees that join in one trunk"¹ Science teaching on a compartmental basis is justified only for specialisation in a subject or for technology. On the other hand a basic knowledge of science, as it exists in nature in the natural surroundings of children, is essential for all. This is possible - only in an integrated course of study wherein all branches of science are included under the name of general science. Moreover in the early stages children see things as unanalysed wholes rather than the components.

Place of General Science.

The Committee² on the Reorganization of science in Secondary schools in America issued a report as far back as 1920 stating that steps should be taken to prevent the increase in specialisation from diminishing the value of instruction from the standpoint of the general needs of the pupils and the needs of society. "It further stated that "general science should provide a basis for discovery of interest in special sciences". It should prove to be the best training for any pupil who can take only one

1. Bacon, quoted by Arthur Thomson in Introduction to Science, page 85.

2. Walter I. Rivers, "Encyclopedia of Educational Research", page 1122.

course in science. The subject matter should be selected from the environment and hence should vary from place to place and should deal with problems of social reconstruction. The science of common use should be the science of the class room. The decision of the All India Committee¹ on Secondary Education to adopt the concentric method of teaching general science is quite in consonance with the above mentioned report. The Science Masters' Association of America² clearly defines general science in the following manner. "General science therefore should be a course of scientific study and investigation which has its roots in the common experience of children and does not exclude any of the fundamental sciences. It should seek to elucidate the general principles observable in nature without emphasising the traditional divisions into specialised subjects until such time as is warranted by the increasing complexity of the field of investigation, by the developing unity of the separate parts of that field and by the intellectual progress of the pupils".

The conditions obtainable in our State are not quite conducive to the teaching of general science at the present stage. The department should have introduced the scheme of science teaching on the topical method after training teachers in the art of teaching an integrated course of science. Most of the teachers do not have the

1. Draft Syllabuses for Higher Secondary Schools, page III.
2. Science Masters' Association of America.

academic qualifications for teaching the integrated course. Hence lack of complete knowledge on the part of the teacher result in lack of suitable interest in the pupils leading to an irregular patched type of knowledge unrealistic in its nature. It is a welcome sign that the department has thought of conducting a content course in science to eradicate - the above mentioned flaw. General science is introduced as a course of study in the University. The prevailing defect would be permanently overcome when graduates with these optionals handle general science in high schools.

Objectives of Science Teaching.

Science under ever since the times of Arabs has had two functions; first to enable us to know things and second to enable us to do things, says Burt-Rand Russell,¹ Science as has already been stated is systematized knowledge. This definition of science is giving way to science as a power for manipulating nature to the advantage of man. Learning or doing of any thing must have some objectives. Evidently teaching of science must also have some clear cut objectives. The Seminar on teaching of general science held in New Delhi in the year 1956² has proposed the following objectives for Science teaching (1) to familiarise the pupil with the world in which he lives and make him understand the impact of science on society so as to enable him to adjust himself to his environment and (2) to acquaint him with scientific me-

1. Bertrand Russell, "The Impact of Science on Society", page 21.

2. The First All India Science Seminar on Teaching of Science in India", page 35.

toed and enable him to develop a scientific attitude. In 1924 Watkins¹ investigated the objectives for general science and his findings were to insure that the pupil acquires (1) an understanding and control of environment; (2) a fund of information concerning nature and science; (3) a preparation for later science courses; (4) a training in the scientific method; (5) development of power of interpretation, and application; (6) development of interest in science and (7) culture.

In 1927 Cureton² found the following to be the most important objectives of general science: (1) appreciation of the values and importance of science as it affects his daily life, so that he may acquire the proper attitude towards those civic scientific issues which he will later be called upon to lend his voice in solving, (2) to develop in the child these general attitudes and habits of broad mindedness, fidelity to truth, careful inquiry and evaluation of evidence in connection with problems and logical analysis of data which will tend to mould his character and temperament in the best manner; (3) to develop in the child interest in the value, worth and beauty of science, so that he may have opened before him a great number of interesting avocations and he may be stimulated to go further into one of the many fields of scientific endeavours, (4) to

1. Watkins Ralph, K., "The Technique and Value of Project Teaching in General Science", General Science quarterly Volume VII, pages 235-256.

2. Cureton, Edward E., "The Aim and Content of the Course of Study in General Science".

develop in the child those particular habits and attitudes and to present to him those particular facts and principles most likely to be of definite use to him both as a child and as an adult, (5) to give the child ~~and as an adult~~ a general preview of science to the end that he may have a better basis for the selection of further science work in school and perhaps in life. A study of high school curriculum in America from 1860-1918,¹ reveals that the values of science teaching could be conveniently classified under the following heads (1) the religious aim (2) knowledge aim, (a) knowledge to the end that the learner may be regarded an intelligent person, (b) knowledge for its practical utility, (c) knowledge for mental discipline. These aims found recognition in educational literature and prefaces of text books. Writing about science study in his book "Natural History" for the use of schools and families Hooker states "This study has a practical learning on many of the most valuable and extensive occupations of man". "The practical benefit is - the discipline which it gives the mental powers".

Geyer F.R.A. in his book "laboratory manual in Biology" writes, "The aim of science teaching is to develop rather than to inform. Hence the laboratory method is more important than the information involved. Accuracy in observation is a pre-requisite for accuracy in description as well as to logical inference". In his book "Elements of Chemistry, Ira Remson said, that the course was not to make chemists

1. Walter Monroe, "Encyclopedia of Education", page 1132

but to help to develop sound aims and awaken interest in important natural phenomenon Smith in his discussion on teaching of Chemistry gives the following reasons for the study of Science. "Our first reason", he says, "rests on the training in observation for which it furnishes the opportunity. The second reason is that it trains the pupil in the organization of his observation by comparison and induction. A third is that of exercise and control of the imagination. He further states that science give training in self elimination (which may be defined as unbiased judgement). He recognized the value of information the study of science imparts. S. Ralph Powers writing in "The plan of public schools and the programme of Science Teaching" ¹ states that "science must be viewed from two specific points - for the immediate educational values for high school pupils; and for the background of preparation they afford for the more intensive and specialized study of the sciences by those who continue in colleges later. Educational values of real significance will be attained if pupils as a result of such instruction acquire (1) the ability to use the scientific findings that apply in their experience, (2) the ability to interpret natural phenomenon in their environment and (3) an appreciation of scientific attitude through the understanding of, and ability to use, some of the methods of study that have been employed by scientists". From the multitudes of

1. S. Ralph Powers, "The Plan of the Public Schools and the Programme of Science Teaching", Thirty First Year Book of the National Society for the Study of Education, Part I, page 10.

the objectives mentioned above the aims of Science teaching can be grouped under four broad heads.

1. Utilitarian aim,
2. Disciplinary aim,
3. Cultural aim,
4. Social aim.

Utilitarian aim.

Children must be given such knowledge of science as has direct contact with the affairs of their daily life. Great importance must be given to scientific principles of wide generality so that their understanding may lead to useful application in solving the problems of life. Science must also be used to harness the forces of nature to the advantage of man.

The disciplinary aim.

Teaching of science must thrill the students and sharpen their minds. It must inculcate in them the habits of accurate observation, separating the relevant from the irrelevant in a purely objective manner, uninfluenced by bias or prejudice. It must develop openmindedness and unyielding attitude to authority and superstition. Teaching of Science must develop the spirit of inquiry. The methodical procedure in experimentation and observation and the scientific outlook they develop in a course of scientific study - should go a long way to help them tackle life problems on a scientific basis.

Cultural Aim.

The culture of a race is the sum total of the modifications and adjustments it has undergone to suit the changing conditions. The social heritage shows us the way our fore-fathers have reacted to certain environmental conditions to suit their interest and the interest of their descendants in similar conditions. Our children should also have something to hand over to the future generation. Teaching of science must arouse their interest in mysterious happenings in their environment and they must quench their inquisitive thirst by self effort. We have inherited the knowledge of aeroplane from our predecessors and we hand over the knowledge of jet planes, atomic fission, atomic energy and inter-continental missiles to the future generation. Knowledge is a legacy from the past and a gift to the future.

Social aim.

Science has and has been changing our social life. Our ways of transportation, communication, agriculture, trade and commerce have all been influenced by science. The world of to-day is too small, when advantages of science are made use of. One may break-fast at Bombay, lunch in London and dine in New York. The child must be enabled to adjust itself to this sort of social progress and the ever-changing ways of life. The child must develop healthy habits, scientific attitude and a corporate way of life.

Measurable outcomes of Science teaching.

In the fore-going paragraph the objectives and aims of science teaching have been dealt with at length. Here mention is made of the measurable outcomes of science. There are five types of major measurable qualities in science - knowledge, skills, concepts and understanding, application and interests and attitudes.

Knowledge.

Information and knowledge are emphasised in science teaching. Knowledge is a necessary criterion for satisfactory adjustment to life, though it cannot be said that mere possession of knowledge would lead to proper reaction. Hence measurement of the knowledge of scientific information is essential.

Skills.

Skill in handling scientific instruments, apparatus and tools and performing experiments is as essential as knowledge. For example the pupil should have the skill to use a cycle pump and should be able to set it right should it go out of order; or he should know how to replace a fuse in case it is burnt out.

Concepts and understandings.

As facts are the vehicles of thought, the relation between facts and generalization is the vehicle of understanding. Attainment of generalized ideas in science is indispensable. Tests on this aspect of learning cannot be lost

sight of.

Application.

Application of scientific knowledge is the most important objective of science teaching. Test items that involve understanding of new situations demand the ability to use scientific knowledge, reasoning and judgement. Test items of this kind must find a place in any testing programme of science.

Interests and Attitudes.

Tests on interests and attitudes are as important as any other outcome of science. They are the signals which indicated the future professions, occupations and hobbies of the pupils. Constructing tests on this aspect of the outcomes is not easy. All the same all possible efforts should be made to test this outcome.

Measurement of Educational outcomes.

In the previous paragraphs enough light is thrown on the broad aims of science teaching and its measurable outcomes. The out-comes of science teaching, as any other subject, have to be subjected to measurement in order that we may reap the full benefit of the programme of science teaching in our schools. "Measurement is the principle implement of science changing that field of human endeavour from medieval gropings into modern exactitude".¹

1. B.Othman Smith, "Logical Aspects of Educational Measurement", page 182.

Sir Galton is of opinion that until the phenomena of any branch of knowledge have been subjected to measurement and number, it cannot assume the status and dignity of science.¹ What are the different types of measurement available? There are two major types of measurement, the essay type and the new type or objective type. Time and again the defects of the old type or essay type of examinations have been pointed out. It is subjective, unreliable, invalid, time consuming both on the part of the pupil and the examiner and suffers from lack of wide sampling and definiteness of questions. It is needless here to go into the details of studies made by Starch and Elliot, Ballard, Falls, Willis, Hulton and others regarding the alarming short comings of the essay type. In a study made in the University of West Virginia, Ashburn² came to the conclusion that 40 per cent of the passes or failures depended not on what they knew but on who read the papers and the passing or failure of 10 per cent depended upon when the papers were read. In contrast to those the new type of examinations are more objective, highly reliable and much more valid. They enjoy wide sampling, dependability and clarity. They are easy to administer less time consuming and more thought provoking.

George Fisher³ an English School Master, realising the subjective nature of the essay type of examinations

-
1. Sir Francis Galton, quoted by I.W. Howerth page 1 of "Measurement of Mental Phenomena".
 2. Robert M. Ashburn, "An Experiment in the Essay Type of question", Journal of Experimental Education, Sept., 1933.
 3. Leonard P. Ayres, "History and Present States of Educational Measurement", Seventh Year Book of the National Society for the Study of Education, Part II, page 9.

proposed a "scale book" made up of various standard specimens of handwriting arranged in order of merit. But this did not produce a lasting effect. Ayres¹ feels that this is due to the fact that the people in those days did not believe that human behaviour was susceptible to quantitative study. The real inventor of the comparative test in America was J.M.Rice.² In 1894 he constructed tests in spelling, arithmetic and language to discover the minimum time required to teach these subjects. It took ten years for his attempts to get the approval of educators. In 1904 Thorndike³ gave the world his memorable book "Mental and Educational Measurements". Thorndike is rightly regarded as "the father of the objective test movement". Stone, a student of Thorndike, published the first standardized test in Arithmetic in 1908. This was followed by Thorndike's "scale for handwriting for children" in 1909. Thus came into use the objective tests in America. Though educators were first opposed to these, the defective nature of the other type of examinations and the objective nature of the new type compelled them adopt the latter.

Even in India educationists have not been blind to the evil effects of the present system of examination. A thorough re-orientation of examinations has been a long felt need. As far back as 1938 the Zakir Hussain Committee

-
1. Leonard P. Ayres, "History and Present States of Educational Measurements", Seventh Year Book, Part II, page 10
 2. Leonard P. Ayres, page 11
 3. Ibid, page 13.

stated¹ "The system of examinations prevailing in our country has proved a curse to our education. A bad system of education has, if possible, been made worse by awarding examinations a place out of all proportion to their utility. Examinations are neither valid nor complete, they are inadequate and unreliable, capricious and arbitrary". The same Committee suggests the administration of objective - tests constructed in consultation with the experts in curriculum making. Dr. Radha Krishnan in his report has clearly indicated the common profound dissatisfaction with the existing system of examination and its down-right condemnation in no unmistakable terms. The report says, "Examinations, as they have been functioning, have been recognised as one of the worst features of Indian education, with its pernicious domination over education they kill all initiative in the teacher and the student have made it almost impossible to provide true education and to develop wider interests and have created temptation of cheating and corruption". In his opinion "The obsession to secure as it were a ticket in the lottery of job-securing has overshadowed the educational purposes which a good examination can serve".² The Commission feels convinced that "If we are to suggest one single reform in education, it should be that of examinations." The Commission suggest, however, is not in favour of abolishing the examination. On the other hand it recommends the improvement of the existing system

1. Munsel, "The Use of New Type Tests in India" -preface.

2. Radha Krishnan, "University Commission's Report", pages 327-339.

by the introduction of "valid, reliable, adequate objective examinations".

The Mudaliar Commission on Secondary Education declares "Examinations have so pervaded the entire atmosphere of school life that they have become the main motivating force for all efforts on the part of the pupils as well as teachers. If any school activity is not related directly or indirectly to the examination it fails to evoke or enlist the students' enthusiasm - they have come to exercise a restricting influence on the entire field of Indian education to such an extent as almost to nullify its real purpose". All the above reports indicate their disgust only with the existing type of examination in our country. This does not mean to advocate the abolition of examinations as such but only a change over to the new objective type of examinations.

Dr. Benjamin S. Bloom, the American expert on evaluation who conducted a number of evaluation workshops in India has revolutionized our conception of examinations by introducing objectivised tests in the field of education. This has given a new fillip to the evaluation technique in India and many efforts are being made in this direction. The present investigation is a humble venture to standardize an achievement test in general science for High School First Year as per the syllabus of the Old Mysore State. The test was administered to a sample of 20-23 students representing the various parts of the Mysore State under various managements and under different socio-economic

society - Urban, rural and industrial. Mysore and Bangalore are taken as urban areas, Mandya, K.G.S. and Bhadravathi as industrial and the other parts as rural areas.

The test is a battery of nine sub-tests. Instructions and samples are given at the beginning of each sub-test.

CHAPTER -II

Achievement Tests.

Achievement Tests - A Brief Survey:

Although the measurement of achievement in Schools, is traced back to many centuries, the objective measurement dates, as already referred to, from the works of - Thorndike and his pupils. In 1918 Thorndike published a paper, the first of its kind, on measurement. It began with the dictum "Every thing that exists, exists in some amount, and that, if it exists in some amount, it can be measured".¹ It counteracted the opinion of those who believed that ideas and emotions could not be measured. The spelling and arithmetic tests of J.M. Rice, the Arithmetic tests of Stone, Elementary test of Curtis, Thorndikes Handwriting scale, Ayres Handwriting scale, Hellegas Composition scale, spelling scale of Buckingham and Starch's Reading Test gave the incentive to objective measurement of Achievement.²

In 1911 Curtis³ reported the results of his test in the fundamentals of arithmetic, administered in the - Detroit School. The report attracted so much attention that Curtis was asked to participate in the New York survey and administer his test to 30,000 pupils. The report

-
1. Ballard: "Mental Measurements, page 2.
 2. Encyclopedia of Education, page 1461-62.
 3. Ibid, page

of the use of tests stimulated much interest among heads of institutions who were eager to compare the achievement of their pupils with the pupils in other schools. Courtis laid emphasis on the importance of norms. Thanks to his valuable efforts, a bureau was established in a number of States to cooperate with school men in administering tests and interpreting test scores. These endeavours led to the popularity of Achievement tests. From 1917 - 28 nearly 1,300 standardized and semi-standardized tests were developed. Surveying the advance the test movement was making, Buckingham¹ observed that the "test making passed from an amateur to a professional basis". Walter Monroe² in his book "Ten Years of Educational Research 1918-27", writes that the pioneer State of Educational Research is passed and quantitative production has been achieved. By 1927 there were developments in the new direction and this indicated a distinct advance. The early standard tests of Achievement were purely of a general or survey type. They were a measure of a pupil's attainment in a subject. They did not give detailed information required for remedial work. These tests gave way to tests of a specific type like diagnostic tests which give specific information regarding the pupil's strong and weak points. The tests were later organized into batteries consisting of survey tests in im-

-
1. R.B. Buckingham, "Our First Twenty Years", Proceedings of the National Education Association, 1941, page 354.
 2. W. Ross, "Measurement in To-days' Schools", page 43.

portant school subjects in a single book-lets. In 1920 two such batteries appeared - one by Pinter and the other by Monroe and Buckingham. In 1922 appeared the Stanford Achievement Test. In 1929 the State University of Iowa inaugurated a State-wide Every Pupil Testing Programme. An innovation in Achievement testing was made by Lindquist in 1942 with the Iowa test of educational development. These tests, designed to measure the basic skills, permanent learnings and attainment of other objectives of education, were substituted for the strictly subject centered tests of the original Iowa Every Pupil Testing Programme.

Achievement Tests in Science:

A good many achievement tests in science have been standardized by various people in America and elsewhere. A brief mention of a few may not be out of place here.

I Stanford Achievement Test.

The format, lay out, spacing and size of type of the Stanford Achievement Test are commendable. This test is found in many forms. Each form consists of seventy items. A great majority of items involves factual information. There is no item which involves judgement and reasoning. All the items are of multiple choice type. Many of these are incomplete statements except a few direct questions.

Each item has three possible answers instead of four or five. There are also some defects. An item when completed correctly reads thus: "Humus is soil found chiefly under trees" The framing of this item is not correct because Humus is one of the three constituents of soil, whether under trees or not.

II Co-operative Biology Test for High Schools:-

This test is constructed by cooperative Test Division, Educational testing service. The test consists of 5 forms. Form Q consists of 120 items. There are five choices given for each item. About one third of the items test biological information. The remaining two thirds are basically factual. Form S is composed of 111 items. About 25 per cent of the items test the application of biological information and the interpretation of materials. The instructions are clear and simple. Data regarding test objectives, construction and validity studies are inadequate. The manual does not say how the questions were selected, what the item difficulty and validity indices are, on which population was the testing data obtained etc. It does not say also how it was validated and how its reliability was determined.

Nelson Biology Test:- 1950-51.

This is constructed for use at the end of a course

in high school. There are two forms of the test. Each of these forms consists of 75 items of multiple choice. The cover page contains directions and samples. The get up of the test is commendable. The questions are clear, direct and free from ambiguity. Importance is given to the understanding of Scientific phenomena and the ability to apply knowledge in the interpretation of situations and solution of problems. The reliability of the test has been calculated by the split half method. It has a reliability of 0.88.

Cooperative General Science Test:-

This is constructed by Paul E Kambly and Carl A Pearson for the Cooperative Test Division Educational - Testing Service. This test has been criticised by S. Richardson, Associate Professor of Education of the Ohio University, Columbia. This test is used as a measure of achievement at the end of course. The number of items in each form ranges from 85 in Form Z to 101 in form Q. With the exception of a few matching items in Form Q, all items are of multiple choice type. Each form is divided into two parts with 20 minutes allowed for the first part and 15 minutes for the second part. There is no apparent order in the listing of the items. There is considerable dependance on the re-call of factual information. To a very small extent principles of science are involved in

determining the correct response.

In item 34 of Form X, the key indicated that the correct answer is "water is a good conductor of electricity". Actually water is a poor conductor till some acid is added to it.

Anderson Chemistry Test:

This test is constructed by Kenneth Anderson. The working time for this test is 40 minutes. Directions and samples worked are found on the covering page. The test is in two forms. Each form consists of 80 questions of the multiple choice type, with five choices in each. This is a test not only of factual knowledge but also of the students' understanding of principles, familiarity with laboratory work, and reasoning ability.

Item 47 in form A reads "Hydrogen gas was passed into a test tube containing copper oxide. Heat was then applied to the tube.

^{asks,}
Item 48_A "Which one of the following statements - gives the principle that test explains the answer to item 47?" (6) Copper is comparatively an inactive metal (7) Metallic oxides often combine with an acid to form a carbonate. (8) many oxygen compounds when heated with hydrogen with release oxygen. (9) Noticeable heat and light occur in many chemical reactions. (10) Some chemical com-

pounds are able to absorb water from air". Answer 8 is considered correct but Reiman considers that item No. 6 also is an equally good answer. Though Reiman, (Professor of analytical Chemistry, Rutgers University, New Jersey) has criticised item 48 in Form A (given ^{above} below), it does not seem to be valid when we take into consideration the knowledge of students as per the ~~specimen~~ ^{level}.

Read General Science Test:-

In this test there are 75 items. The time is 40 minutes. The distribution of items by content areas is; Physics 42 per cent; biology 28 per cent; Chemistry 4 per cent, and general 26 per cent. The sampling of the areas does not allow of adequate diagnosis of academic achievement. The wording is clear and exact. There is considerable reliance on the re-call of factual information and utilization of principles of science. Benjamin S. Bloom has highly commended this test from a statisticians point of view. Preliminary forms of the test were administered to 1,600 students in 12 high schools in 8 States near the close of the year. The mean IQ of the group was 102. The mean validity index (item total correlations) was computed and found to be .42 and .43 for the two forms. Items were selected so as to yield two forms of the test precisely balanced in difficulty of 53 per cent and composed of items known to be of significant discriminating power. The reliability coefficients

are .85

Objectives and content to be tested were drawn from an examination of widely used text books, state curricula, and samples of courses of study.

Even in India, as already referred to, attempts have been made in recent years to construct and standardize achievement tests in science. These have not been popularized. Some of the tests are in the regional languages, as for example, the one constructed and standardized by M.S. Chandavarkar, B.A., B.Sc., M.Ed., of the Karnatak University under the guidance of Dr. V.V. Kamat is in Kannada; and the other, an M.Ed. dissertation in general science submitted by Sri H.H. Pawar, B.Sc., LL.B., B.T., is in Hindi. The Psychological laboratory, Maharaja's College, Mysore constructed an Achievement Test in Elementary Science for V Form some years back. The test consists of 60 items of the Multiple choice type. Each item has four responses. This test has not been standardized. The test constructed by Sri M.S. Chandavarkar and published by Macmillan and Co., is intended to measure the knowledge of children between the ages of 8 and 18 in General science in Bombay-Karnatak. It consists of 100 items. There are 20 items of the simple Recall type, 18 items of the True False type, 15 items of the Association type, 15 items of the Alternative Response, 15 items

of the matching type, and 15 Alternative Response type. This was administered to 4,626 pupils. Norms, reliability and validity have been found out. Incidentally he has found out also the interest of children in the various branches of science.

The reliability of the test has been calculated by the split-half method. It is 0.89. The validity of the test has been calculated by comparing test scores with the examination marks. The co-efficient of correlation for various standards has been calculated. It lies between 0.37 and 0.66.

Sri Jagannath, B.Sc., B.T., M.Ed., Head Master, Sri Rama Krishna Vidyalaya has constructed in part fulfilment of his M.Ed. Course in the Institute of Education, Delhi, an achievement test in Physics; but it has not been standardized. He tried it on 200 students of the XI Standard of the City of Delhi. The test proposes to measure principles and basic concepts in Electricity and its every day applications. There are 25 items of M.P. choice type, 35 items of T.F. type, 29 items of problem and completion and 5 diagrams. He has found out the norms, reliability and validity of the test. The reliability is 0.65 and validity is 0.71.

Sri H.Venkataramaiah, B.Sc., B.T., M.Ed., Lecturer, Teachers' College, Mysore standardized an achievement test

in 1958 in General science Part I (Physics and Chemistry) for High School III student of Mysore State. The test consists of 30 items of T.F. type, 16 items of Multiple choice type, 20 items of the matching type, 18 items of the completion type, 7 items of the reasoning type and two diagram tests. He has found out the norms, reliability and validity of the test. The test has high norms of 54.77 and it is highly reliable and valid. It was administered to 2000 students selected from various strata of society. The investigator has given the minutest details regarding the standardization of a test in a very lucid manner. However, it would have been better if he had the test - items on Biology also. This would have given a complete picture of the attainment of the ^{high} boys in General Science as a whole.

Nature of Achievement Test.

The attainment or acquired ability of a pupil in a subject of study is termed Achievement. The Achievement test measures the ability to do use or understand a certain thing based upon the knowledge, method, attitude, interests and skills a pupil acquires from instruction or experience. The kind of achievement to be measured depends upon the nature of the subject and the

various objectives of its teaching or learning.

There are two types of Achievement tests, General or *summary* tests and Diagnostic tests. "A General achievement test is one designed to express in terms of a single score a pupils relative achievement in a given field of achievement"¹ A diagnostic test on the other hand is designed to diagnose the deficiencies in learning and teaching in one or more areas of achievement. A battery of tests consists of different kinds of tests and each kind tries to find out the specific weakness, errors or gaps in attainment in a field of achievement, as for example a pupil's weakness in acquisition of knowledge, use of knowledge, (problem solving capacity) skill in - performing experiments. Each of these tests is of the general achievement type and the whole test is diagnostic.

An achievement test may be constructed by a single teacher or a team of teachers for use in a class room. These are called informal tests. When a test is constructed carefully, systematically and scientifically in consultation with experts and experienced teachers and when it is tried and retried on a wide sample in a natural homely atmosphere and when certain characteristics, such as norms, validity, reliability, usability and predictability are determined, it is called a standardized test.

1. Hawkes: "Achievement Examination", page 23.

A standardized test has a wider objective than an informal test.

Functions of Achievement Test:

The value of a testing programme depends upon the extent to which its results have been helpful in improving learning, instruction, guidance and administrative practices in schools. The achievement test, an important type of measurement, has all the useful functions referred to above.

Influence On Learning:

An achievement test clearly indicates the type of learning or study procedures adopted by students. Even though Richardson and Stalankar¹ are opposed to the belief that an achievement test would always have a pedagogic value, this should not be an obstacle in finding out the influence of examinations on learning. Meyer² reported two studies on the type of examinations and memory, and type of examination and study procedures employed by students. The findings indicated that the type of examination does influence the nature of students' study. Johnson reported that testing stimulates learning and Spitzer concluded that testing helps in the retention of learning. We may therefore conclude that measurement influences -

1. Max D. Eagle Hart, "Encyclopedia of Education", page 411.

2. Ibid, page 411.

learning.

Measurement and Instruction.

Any teacher is keen about the effects of his teaching. This he realizes by the use of objective tests which throw some light both on the capacity of his students and his methods of teaching. The teacher would be able to gauge the good or bad points in his teaching methods. With the help of the test results he would also adopt the necessary remedial measures to achieve the necessary objective of the subjects taught.

Measurement and Administration :

The healthy running and progress of an institution on the right lines is the responsibility of the administrator. It is his duty to see that proper methods of instruction are employed and the pupils achieve the various objectives of instruction. This can best be evaluated by the use of well constructed objective tests. These tests indicate not only the achievement level of the students, but also diagnose whether his suggestions if any have been followed or not.

Achievement Tests and Counselling:

Counselling, as mentioned by John Darby,¹ "is the process in which information about the individual and about

1. John Darby, "Educational Measurement", page 68.

his environment is organized and reviewed in such a way as to aid him in reaching workable solutions to a variety of adjustment problems in the normal range of behaviour". School administrators are highly criticised for not identifying the abilities of pupils and for not directing them away from the fields in which they do not seem to have an aptitude. This can be easily overcome by the use of the new objective devices. The evaluation records of pupils show their worth and with the help of these - their energies can be directed towards right ends. They can be counselled about the vocation or career they should choose in accordance with their attainments of certain - skills, attitudes and concepts. They can also be guided with regard to the course of study they must choose for entry into a particular type of job or vocation.

Achievement Tests and Educational Placement:

Placing pupils who are normal for their group under the same group is a proper method of placement. Pupils alike in their chronological age, educational achievement, physiological, mental and social development must be placed under one group. The result of objective measurement can be used in determining the pupils placement in the group. Through the development of reliable grade and age norms based upon the achievement of groups of children in standardized tests, a valuable instrument for establishing a

grade line is made available. Achievement of children in standardized tests is made use of in admission into various kinds of colleges, in awarding scholarships and in the selection of personnel in the various branches of social activities. For example, the army alpha test was used for the purpose of selection of officers to man the armed forces.

Principles for Achievement Test Construction:

The objective test construction, as any other work must be based on certain cardinal principles. The constructor should know the purpose his test should achieve. He must know what to measure and having fully and clearly understood this, he must think of the ways and means of measuring it. If he should know what to measure he must have a clear knowledge of the objectives of teaching and learning a particular course of study. It is not enough if he knows the broad objectives of such a course of study. He must have a clear insight into the required modification in behaviour such a study is likely to bring. Lindquist in this connection observes that "if measurement is to continue to play an increasingly important role in education, measurement workers must be much more than technicians. Unless their efforts are directed by a sound educational philosophy, unless they accept and welcome a greater share of responsibility for the selection and classification of educational objectives and unless they show such

more concern with what they measure as well as how they measure it, much of their work will go in vain".¹ Educational measurements have a great influence on the educational process and its improvement. The ability of the test constructor to know the situations in which tests are essential and useful or their influence on educational practices is as important as the ability in test construction. His test must be valid and dependable. What his test measurement must be of importance and significance and its use must exercise a desirable influence upon the aims, habits, attitudes and achievements of students, - teachers, counsellors and school administrators. The first and foremost thing a test constructor must do is to formulate the objectives of his test or what it proposes to measure. This ~~is~~ implies what a particular field of study proposes to achieve. The objectives of teaching and measuring are interdependent. What then are the - sources of getting the general objectives of teaching and learning a particular subject? According to Walter Monroe² there are four sources of formulating the objectives.

- 1) Anx analysis of the text book on the subject,
- 2) Analysis of the courses of study,
- 3) Analysis of teacher made tests,
- 4) Opinion of experts on the subject.

1. Lindquist: "Educational Measurement", page 158

2. Walter Monroe, "Encyclopedia of Education", page 1466.

The last of these sources is the most important one. Text books, courses of study, examinations and teacher made tests - all depend on expert opinion.

If text books are not written with due care taking into account the purpose of such a venture, examinations or tests constructed on the basis of these text books - measure just what is taught and not what should be taught. They do not take into account the modification in the behaviour of the pupil resulting from such instruction.

Objectives resulting from an analysis of the courses of study have an advantage over the previous type as they attach more importance to application of facts, principles and generalizations than factual knowledge.

An analysis of the teacher made tests gives us an idea of the opinion of a number of teachers about the importance to be given to a topic of study in a given field. Unless these tests keep in view the why and how of things, they are not helpful.

Dr. Benjamin S. Bloom, the College examiner of the Chicago University and expert on evaluation, conducted a number of evaluation workshops while in India in the year 1958.

He suggests - that a teacher or a test constructor

should first define the objectives of teaching a particular subject and should break down these into proper changes of behaviour expected in each pupil. To effect these changes of behaviour, learning situations have to be provided. After this comes the stage of test construction.

This means that an achievement test constructor focuses his critical attention on the objectives of education. This results in a systematic analysis, classification and restatement of the educational objectives. - Mere informational tests have been highly criticised by experts on measurement. Lindquist states "Good testing, as well as good teaching should penalize rote learning rather than place a premium upon it. A good test in this respect is one in which, among other things the constructor has assiduously avoided the use of text book language or of stereo-typed and catch phrases or pat verbalization likely to be acquired by the rote learner".¹

The Iowa tests of Educational development constructed by Lindquist have the following titles for the individual tests (1) Ability to do quantitative thinking, (2) Ability to interpret Reading material in the social studies, (3) Ability to interpret reading material in the natural sciences, (4) Ability to interpret literary material, (5) Correctness in writing, (6) Understanding of the basic

1. Lindquist: "Encyclopedia of Education", page 1466.

social concepts, (7) Background in the natural sciences, (8) General Vocabulary, (9) Use of sources of information. These titles give us an idea of the important educational objectives and the types of tests in an over all evaluation programme.

Some testing techniques.

It is quite beyond the scope of this work to have a complete and exhaustive discussion of the various types of tests. However, it is worth devoting a few pages to a brief treatment of these so as to give an idea about - their uses and limitations, and the various pitfalls that are to be carefully guarded against in constructing the test items.

1) Alternate Response:

This is one of the most popular forms of the simple recall type. Alternate response items are those in which only two alternatives are presented to the pupil for his response. More often than not, it takes the form of True false statements requiring the pupil to establish the - correctness or otherwise of the given statement. Some times it requires the pupil to mark merely a 'Yes' or 'No' against each of the statements and some times involves the selection of the correct or the better one of the two responses presented as possible comparison in a given -

situation. However the 'true - false' reigns supreme as the most widely used alternate response type. It involves a very simple method of response in the aligned answer positions of the test items. It is widely applicable in all subjects fields. It is generally believed to be easy to construct; however in actual practice, the elimination of ambiguities is often difficult, if not impossible, to accomplish. Yet, they can be used satisfactorily in many situations if they are constructed carefully enough to keep them free from ambiguity. They have the advantage of affording a wide coverage in a short period of time and serve a very useful purpose in the measurement of a functional type of instructional outcome. On the other hand guessing is more of a problem for this than for any other type and hence of little diagnostic value.

The following suggestions may be borne in mind while constructing the alternate response items.-

- 1) Avoid double negative statements for they serve no useful purpose and are often likely to needlessly confuse the pupil.

- 2) Do not use statements that are partly true and partly false. They add nothing to the test and intentionally or unintentionally take the form of 'catch' items.

3) Do not use specific determiners such as always, never, none, only, nothing etc. except with great care and as sparingly as possible.

4) Require answers in a simple but highly objective form.

5) Have a random distribution of true and false items and let there be no definite proportion of true and false items.

6) Make the crucial element in the question as obvious as possible to avoid ambiguity.

7) Avoid the use of text book language.

8) Avoid the use of general terms such as large, small, great, well-known, many, few etc., when fine distinctions are involved, or when the meaning is not obvious.

Completion:-

This is another form of the simple recall type and very commonly used. A completion item typically consists of a sentence or a paragraph from which key words have been omitted and blank spaces provided. The pupil is required to complete the statement by placing the proper words in the blank spaces. This is applicable to almost all achievement fields, easy to prepare and is likely to encourage more thorough study habits. On the other hand

it is over rated from the stand point of requiring understanding rather than rote memory, not highly objective unless great care is taken in construction and scoring, subject to over mutilation and time consuming.

The following suggestions are offered for the construction of completion items.-

- 1) Make each blank call for the completion of a single idea.
- 2) Avoid too many blanks.
- 3) Make all blanks the same length to avoid giving clues.
- 4) Avoid text book wording.
- 5) Avoid clues afforded by the requirement of grammatical consistency.
- 6) Make the statement sufficiently complete to enable the pupil to interpret the item correctly.
- 7) Omit only the key word or words.
- 8) Provide positions for responses ordinarily, at the end of the sentence.

Multiple Choice. -

The multiple choice type is a form of the recognition item type and has come to be 'the most popular form for standardized testing of recent years; and ^{is} ~~are~~ increasingly coming into wide use for informal objective testing as well". A multiple choice item usually consists of an

incomplete statement followed by from three to five plausible alternatives that will complete the statement. The pupil is expected to choose the correct or the best response and to indicate his choice by an answer appearing in a column at the left or the right side of the test paper. It may be in the form of a question rather than a statement or may consist of three to five words, symbols or numbers from which the correct or the best one is to be chosen by the pupil. The multiple choice and its various forms are widely adaptable to different types of content as is the case with true false type. It is readily adaptable to the measurement of "discriminative power, inferential reasoning, interpretative ability, reasoned understanding, generalising ability and other types of outcomes deriving from the pupils ability to apply and use facts". But multiple choice items are not as easily constructed as some other types of tests because of the various technical problems involved requiring great care in the drafting of items..

Some of the important points to be remembered while constructing multiple choice items, are.-

- 1) Use only one form of multiple choice in the same section of the test.
- 2) Use at least four or five possible responses in order to minimise chance successes.

3) Do not mix items with varying number of possible responses in the same test if the scores are to be corrected for guessing.

4) Make the alternatives plausible.

5) Have the alternative answers at the end of the statement.

6) Do not ordinarily use "a" or "an" to introduce the alternative answers.

7) Distribute the correct responses with approximate equality among possible answer positions.

8) Use a random occurrence of the correct responses.

9) Require the answers in a highly objective form.

Matching. -

Matching exercises may be considered as combinations of multiple choice items in such a manner that the choices are compound in manner. This type of test requires the matching of items placed in two or more columns. To prevent guessing extra items may be placed in the response column. The pupil is usually required to write the number of the matching item in a space provided for it

Matching exercises are widely applicable, easy to construct, fairly free from guessing and economical of space and time. But they are not suitable for measuring reasoning, understanding and judgement. They are susceptible

to clues and more adapted to measuring factual memory.

The following suggestions will be helpful in the construction of the matching type.

- 1) Provide only one correct matching for each item and make the items mutually exclusive.
- 2) Take care to see that there is consistency of grammatical form.
- 3) Maintain the consistency of classifications. Each of the two lists should contain items that are of the same category.
- 4) Make the matching sets neither too short nor too long from ten to fifteen pairings are probably optimum for balanced matching groups.
- 5) Arrange the items in random order in each test.
- 6) Have all the matching items on the same page.
- 7) Require the answers in a highly objective form.

Classification Test.-

To a casual observer, this seems to be very much like the multiple choice. In fact, most of the rules which apply to the construction of multiple choice items apply to this type of test as well. But a careful examination of the mental processes involved reveal that it is quite different from the multiple choice. The

classification test requires the pupil to discover a common relationship among four out of five words, which is not shared by the fifth which is to be eliminated from the group. This form of test is suitable for measuring the capacity for reasoning and judgement.

Analogies.-

This type of test involves to a high degree, rational thinking, reasoning/^{and} judgement and the education of relationships and correlates. It consists of three words, two of which bear a definite relationship themselves. Not only the pupil is required to discover the relationship that exists between the two, but has also to find the correlate for the third. It discourages, as in the case of classification, rote learning and guessing and puts a premium on effective thinking.

Enumeration.-

Enumeration is a form of the simple recall type in which the candidate is asked to enumerate properties, uses, and such other things. Enumeration test usually requires from three to five responses. This type of test is not much reliable as it lacks objectivity. However it is easy to construct and can be used to test factual knowledge.

Diagram Test.

Diagram test items are based on pictures and graphical representation. But they are not commonly used owing to various reasons. Good pictorial items can be used to measure useful skills, detection of - defects and critical observation.

CHAPTER -III

Construction of Achievement Test in General Science:

Construction of an Achievement Test, as any other construction requires deep consideration of many important factors:-

1. Planning the test
2. Preparing the test
3. Trying out the test
 - a) Pre-try out
 - b) Try out
 - c) Item analysis
 - d) Administration of the final test

Planning:

This is a very important factor if a testing programme, is well planned, it saves wastage of time, overlapping and confusion. It must have well defined objectives, must specify the nature of the pupils to be tested, and indicate how the test scores would be put to use. ("Good Tests do not just happen, nor are they the result of a few moments of high inspiration or exhaltation. On the contrary the process is calm deliberate, and time consuming it cannot be emphasised too strongly that the actual process of test construction must be preceded by careful planning if the test is to be successful. The test will be no better than the quality of the thinking

Page 25

that goes into it. In planning the test consideration must be given to the nature of the objective to be measured, the purpose it is to serve and the conditions under which it will be used".¹

2. Preparing the Test.

Vaughn suggests, "an achievement test in courses of study to some extent at least be based upon what the pupils were actually taught rather than upon what some one may think should be taught".² The preparation of the test must take into account not only the content taught but consider also the behavioural modifications any programme of instruction is expected to bring about. That is to say an attempt should be made to ensure curricular validity. This then should keep in view the precise objectives to be measured and the areas of instruction from which they are to be measured. Hence in accordance with the above principles the following objectives were listed for measurement in this investigation.

1. Knowledge of fundamental concepts and principles of general science.

2. Reasoning and interpretation of scientific data.

3. Application of scientific knowledge.

1. Ross and Stanley: "Measurement in To-days' Schools" pages 140-141.

2. Vaughn: "Educational Measurement", by Lindquist, page 100.

4. Critical observation.

These objectives were spread over the subject matter field as follows.

Physics	..	109
Chemistry	..	77
Biology	..	97
		<u>283</u>

Lindquist suggests, that in the construction of an achievement test, a number of text books in the subject be analysed to secure a tentative test of topics to be tested and the importance to be given to each topic. In addition to this a detailed study of the curriculum, the opinion of experts, a critical study of the examination papers and standardized tests in the field is inevitable. Hence in this investigation the following text books of Science prescribed by the department were analysed for the selection of topics for constructing test items.

1. High School Physics by J.G. Srinivasa Rao.
2. High School Physics by T.R. Parmeshwaran
3. High School Science by Gregory and Hodges
4. High School Chemistry by T.S. Krishna Iyengar
5. Text Book of Chemistry by T.S. Krishna ^{machay} Iyengar.
6. Introduction to Biology by N.S. Veerappa.
7. Introduction to Biology by Sundareshan

The syllabus in General Science enclosed in the

Appendix A was critically analysed with regards the importance to be given to each topic. In addition to this a detailed study of the (1) public examination papers, (2) class examination papers, (3) standardized and semi-standardized tests, (4) notes of lessons of subject teachers, (5) class notes of students in the subjects was made. The opinion of the experienced teachers in the line was taken and the investigators experience as a teacher was made use of in constructing test items.

Last but the most important of all was to consider the reports of the Zakir Hussain Committee, Radhakrishna University Commission Report, J.P. Reddy's Report and the Lakshmanaswamy Mudaliar Committee's Report for the selection of the objectives and the type of examination to be adopted.

The task of writing the test items was taken up after the above mentioned consideration. "Item writing is an art. It requires an uncommon continuation of special qualities. It is mastered only through extensive and carefully supervised practice. As item writing is essentially creative, just as there can be no set formula for producing a good story or a good painting, so there can be no set of rules that will guarantee the production of good test items".¹ Though according to Elie² Robert there can be not set rules on item writing, it is done according to certain ^{cardinal} conditional principles.

1. Elie Robert: "Educational Measurement", American Council on Education, 1955, page 186.
 National Institute of Education
 Library & Documentation

The language must be simple, appropriate and within the understanding capacity of the pupils. The sentences must not be very long. Each item should allow not more than one answer. There should be no room for ambiguity. There must be minimum writing on the part of the students as far as possible answers must be secured on one side of the paper for easy scoring. "In test construction the prime requisite from the point of scoring is that those pupils reaction to the test which are to be scored be as simple, abbreviated and controlled as possible and the reactions have a definite spatial location".¹ The preliminary draft should include more items than needed in the final test. This facilitates culling out the appropriate from the inappropriate ones at a later stage. This necessitates that every type of tests must be one and a half times as long as the final one. As far as possible the ^{construction} ~~set-up~~ of the present test items is in conformity with the above mentioned principles. 283 items were constructed they were spread over the various types of tests as shown in the table below.

1	True false	..	60
2	Modified true false	..	30
3	Multiple choice	..	30
4	Matching	..	21
5	Completion	..	30
6	Classification	..	25
7	Analogies	..	20
8	Enumeration	..	31
9	Problem	..	15
10	Diagram	..	21

1. McJall: "Measurement - .. " page 66.

These items were subjected to the critical scrutiny of expert subject teachers and improved on the basis of their suggestions. These items were assembled into the form of a battery. Thus a battery of ten tests was prepared. Instructions were given at the beginning of each and samples were worked out.

The next step in the programme of test construction is to subject the test to a few trials. This is an important step in test construction and standardization. This way this can be standardized both for its content and method of administration in order to facilitate proper evaluation in its final form regarding its quality and the quality of pupil responses.

Trying out the Test.

The next step is to try the test on a representative sample of the examinees.

According to Jonard¹ the following purposes are served by a try out.

1. To identify weak or defective items and to reveal needed improvements. To identify ambiguous, indeterminate, implausible distractors, over difficult and over easy items.
2. To determine the difficulty of each individual item,

1. Herbert S. Conard: "Educational Measurement...." page 250.

in order that a selection of items may be made that will show item difficulty, appropriate to the purpose of the finished test.

3. To determine the discriminating power of each individual item.

4. To provide data to determine the number of items to be included in the final test.

5. To find out the time limits for the finished test.

6. To discover needed improvements in the mechanics of test taking in the directions of to examinees regarding the method of recording their responses.

7. To determine the inter-correlations among the items in order to avoid overlap in item selection.

Pre-Try-out.

By pre try out is meant a sample try out on a small sample of examinees for the purpose of finding out gross defects and short comings in the test with no idea of analyzing the data for individual items. It is just a step to find out how the pupils to react to the test. The sample may consist of half a dozen to 100 examinees, or a few adults who try to put themselves in the position of students for whom the test is intended.

This test was preliminarily tried on 40 students of

High School II Year of the Maharaja's High School, Mysore. (The time taken for answering the test was about one hour and 45 minutes). The opinion of the boys about the test was taken. They found the test to be interesting and not very difficult. In addition to this the test was administered to the 20 T.J.H. and 20 T.J.L. students of the Government Training College for Men, Mysore, who had studied the same topics. They also found the test to be interesting and of average difficulty.

Findings of the Pre-try-out.-

The test on the whole was found to be neither easy nor very difficult. There was no sign of disgust or indifference in the testees on the other hand a lot of interest was evinced by them in answering the test. Some vague and difficult items were detected. Out of the 283 items given 17 were discarded and the remaining 266 items were grouped under 10 sub-tests. Instructions were given at the beginning of each sub-test and examples were worked out. A copy of the booklet is given in the appendix B

Try-out.

This trial of the test as has been already pointed out is to find out the various kinds of defects in the test items, instruction, type of administration, time length required, difficulty value and discriminating index of each item. Lindquist suggests that if one try out does not point out

all the defects present in a test it may be given two or more try outs. This means physical and financial burden. This can be avoided if necessary pre-cautions are taken to administer the test as far as possible under ideal conditions.

The sample of the try-out must be similar to the one intended for administering the final test. The sample - must be efficient that is to say, the sample must give valuable information about the population. The sample must be of adequate strength. But it is not the number tried that is important. The areas or schools from which it is drawn is of importance. A sample of 200 students from many schools drawn from different strata of society is - much better than taking the entire sample from one or two schools.

The precautions to be taken into consideration while administering the test, the conditions under which the test is tried and the directions to the examinees should be similar to those while administering the final test.

Time Length

Sufficient time must be allowed for answering the test so that a great majority of the testees must be able to - answer almost all the items. The time required for answering the test items should not be usually longer than the

school period to avoid the difficulties in the problems of management.

Motivation.

The active cooperation of the testees is essential if the testing programme is to be a success. To secure their cooperation they have to be motivated. There are various methods of motivating. Arthur Taxler¹ suggests that the pupils must be informed before-hand the purpose with which the test is given and the influence it will be having on the students.

Guessing.

There is no agreement on the method to be adopted in directing ^{pupils with regard to guessing} Some suggest that strict instructions must be given not to guess. If all follow this instruction the problem of guessing would be eliminated. But inspection of these instructions some would surely guess. This way those who also could have guessed correctly and got the - advantage stand to lose.

Some others suggest that every pupil must be asked to answer every item whether he knows it or not. This allows free and uniform guessing. After applying the - correction formula the true score can be gauged. This method makes students careless and adopt loose thinking.

1. Arthur Taxler: "Educational Measurement", page 345.

Guessing may be of two types, wild guessing and honest guessing. In wild guessing or dishonest guessing the guesser does not know the correct answer. He takes a chance by choosing some response wildly. Whereas in honest or intelligent guessing the pupil has partial knowledge and he guesses a right response with the help of his partial knowledge. Some suggest that pupils may be asked to guess intelligently. But it is not possible to know who have guessed wildly and who have done it intelligently. The application of the correction formula will not be justified in the case of those who have guessed intelligently.

Directions to the examinees.-

A study by Weidemann¹ and Melvens indicated that the nature of the directions may have considerable effect upon test scores. They tried five sets of directions - for giving tests involving true-false and indeterminate statements and found significant differences in the resulting scores. The directions must be clear and concise.

In this investigation the test (the battery of 10 sub-tests consisting of 266 items) was tried on 172 students of High School I Year at four High Schools in Mysore City, situated in different areas of the City, representing the different strata of society, the Maharaja's, Vidyavardhaka,

1. Weidemann and Melvens: "Educational Measurement", page 352.

Christ the King's Convent and the ^{Good} Shepherd's Convent.
 The schools were requested well in advance to make proper arrangements for the conduct of the ^{test} on an examination level.

The cooperation of the Heads of the institutions and the teachers was made use of for smooth conduct of the test. The pupils were informed that they would be having a new experience in answering this new type of test and answering this would revise their portion in General Science and this would help them in their promotional examination which would come off in a couple of days.

Examples given at the beginning of each sub-test - were worked out on the board with their help. Thus the method of answering each type of test was explained. After this they were given the test booklets with strict instructions not to open them till they were so asked. They were asked to fill in the blanks on the facing sheet and read the instructions carefully. Instructions were - given that they should not guess as this would reduce - their score. They were given the opportunity of clarifying their doubts and ^{cautioned} ~~cautioned~~ that they should not ask any question after they begin to answer. They were asked to begin on hearing the signal 'start' A time piece was kept on the table. The time taken for general instruction and working examples on the board was noted to the

be half an hour. They were asked to note the time they start and finish each type of test. The total time taken by about 90 percent of the boys was found out to be about an hour and a quarter. The details of the time taken are given below.-

Statement showing the time taken for answering different Tests.

	No. of items.	Time taken.
1 True false	50	12 minutes.
2 Modified true false	30	10 "

Scoring:

Advice of Kenneth Bean¹ was followed in getting the answers noted in the booklet in a vertical column by pro-

1. Kenneth L. Bean: "Construction of Educational and Personnel Test".

See Appendix

providing a space on the left hand side of each question. This made scoring easy. Each right response was awarded one mark.

Item Analysis.

After a test is administered the pupils' reaction to the test must be found out. Unless there is correct information ~~is~~ got about pupils reaction to an item its inclusion in the final test is not justified. The worth of a test depends upon the worth of the individual items in it. According to Walter Monroe¹ the effectiveness of an item in a general achievement test depends upon - three interrelated factors - (1) the validity of the item from the stand point ~~of~~ content, curriculum and educational objectives, (2) the discriminating power, (3) the difficulty of the item. The first of these factors has been dealt with under "Test construction" The other two are discussed here. The purpose of ~~the~~ difficulty value and Discriminating index is to find out how hard an item is for the group tested and how well it discriminates between the strong and weak students.

Difficulty Value.

The difficulty value of an item is the percentage of pupils that have answered the item correctly. When we say the difficulty value is 75 per cent it means that 75

1. Walter Monroe: "Encyclopedia of Education", page 1470.

per cent of the pupils have answered the item correctly. The greater the difficulty value the easier is the item. The difficulty value of all the items in the different sub-tests was calculated and tabulated as shown in the table.

Discriminating Indexes.

The purpose of educational measurement is to grade pupils according to the degree of their achievement. This implies a great discriminating power on the part of the test. If the test as a whole should have this capacity every item in the test must boast of a high discriminating index.

Discriminative power of a test means that a different quality or response may be expected from different pupils. Superior pupils should answer the item correctly better than the inferior pupils. This assumption gives a procedure for finding of the discriminative index.

Some suggest that after scoring the test book lets they must be arranged in a descending order with the highest score at the top and lowest score at the bottom. The number of persons answering an item incorrectly in the lower 27 per cent, must be found out. The number of persons answering the same item incorrectly in the higher group must be found out. If the item really distinguishes between the good and the bad students then $W_2 - W_1$ must be significant and positive. From the method both diffi-

culty value and discriminative efficiency can be found out by using the psychometric Research and Service Chart of Davis which is perfected by Tri B. Dasguptha. To use this table the minimum number of examinees must be 370. Since the number of examinees in this try-out is 172 the above method could not be used.

The other method is the whole group is divided into three groups after arranging the scored booklets in descending order of the obtained scores. The number of correct responses for each item by the pupils in the upper 1/3 is found out. This is compared with the responses that item secures from the lower 1/3 and the D.I. is calculated by using the formula.

$$D.I = \frac{U - L}{N/3}, \text{ where D.I. is the discrimina-}$$

tive index.

U = correct responses an item secure from the upper 1/3

L = correct responses - the lower 1/3

N = Number of examinees.

Comparison is made between the high and the low group. The item which secures a higher response from the upper 1/3 than the lower one discriminator well between the able and the backward pupils or the strong and weak knowledge. An item which has a zero dis-crimination between the response of these groups is useless. The item which receives

a higher response from the lower 1/3 than from the upper 1/3 has a negative discriminative. This is a detrimental item. It has to be either modified or discarded.

In this investigation the latter method was used. The scored book-lets were arranged in a descending order of the obtained scores. The response of the upper 1/3 for each item was found out. Similarly the response of each item in the lower 1/3 was found out. The result was arranged in the tabular form as given in the ^{Appendix G,} table below. With the help of these the difficulty value and the discriminating index were calculated.

Selection of Items for the Final Test.

After finding out the difficulty value and discriminating index of the test items, the next step is the selection of the items for the final test.

The determination of the optimum difficulty of the test item to be used in a standardized test is a problem of controversy. Some are of opinion that there must be roughly equal number of items at all levels from or very easy to very difficult. Some other maintain that apart from a few easy and a few difficult items the majority of the items must be of 50 per cent difficulty level.¹

Writing in the journal of psychology P.K. Roy also

1. Green, Jogerson and Gurbrich: "Measurement" Evaluation in Secondary Schools" - page 90.

maintains that though in an ideal test each item must be of 50 per cent difficulty level it is not desirable that all items must be of this level. "It can be demonstrated statistically that an item passed by 50 per cent of a group discriminates between more pairs of persons than does an item passed by say 40 per cent or 60 per cent". "But it is not desirable, however, that items shall all appropriate the level of 50 per cent pass. We should try to include both easy and difficult items".¹

(The common practice follows the latter suggestion of Sri P.K. Roy. Any item which is answered by all the pupils and any item which is not answered by all the pupils has no place for inclusion in a standard test.

On the above considerations 120 items were selected. Test items mostly lying between 20 per cent and 80 per cent difficulty level and having a discriminating index between .21 and .7 were selected. However a few items of a higher difficulty level and a lower discriminating index were also selected so as to safeguard the curricular validity.

The following table gives the types of tests and the number of items selected in each type.

1. P.K. Roy, Journal of Psychology, January 1952, pages 31-39.

Types of Tests and Items selected for the Final Test.

Type	No. of items in the Try-out.	No. of items selected for the final test.
1 True false	50	20
2 Modified true false	30	10
3 Multiple choice	30	10
4 Completion	25	10
5 Matching	21	10
6 Classification	25	10
7 Analogies	18	10
8 Enumeration	31	20
9 Diagram	21	20

Final Test form.

120 items were selected on the basis of item analysis, satisfying curricular validity, difficulty value, and discriminative index and they were arranged in the ascending order of difficulty. The next step was to fix the time limit for answering this test. The time taken to answer the try-out was found out for each sub-test and the test as a whole. It worked out to be 85 minutes for 266 items. Lindquist and Hawkes and Mann suggest that "Try to adjust time allowance, except in a rate, or speed test so that at least 75 per cent of the pupils will have time at least to consider all items in each section"¹

1. Lindquist: "Achievement Examination", page 116.

Rush is more liberal, he favours time limits "so that 90 per cent can attempt all items within their power"¹ A time allowance of 45 minutes was fixed for the final test in accordance with the above two suggestions. The time fixed was purely meant for answering the test items after all the directions and instructions were given for each sub-test. Each item was subjected to the scrutiny of the science staff of the Teachers College and the Practising High School at a series of meetings.

The English version of the test was translated in to Kannada with the help of experienced science teachers. Two Kannada Pandits of the Practising High School scrutinised the Kannada version of the test with regards to spelling, grammar language and punctuation. Needed improvements and modification as per the suggestions of the Science teachers and language experts were effected before the items were drafted in the final form.

The Get up or the Format of the final Test.

According to Thorndike² the following considerations must be kept in view in the get up of a test.

- 1) Legibility, (2) Convenience in taking the test,
- (3) Convenience in scoring the test, and (4) attractiveness.

The test was got printed legibly both in Kannada and

1. G.M.Rush; "The Objective or New Type Examinations", Chicago, Foresman & Co., 1929, page 312.

2. Thorndike; "Personnel Selection", page 86.

English media.

The important directions were got printed in the cover page of the book let. Instructions given at the beginning of each statement were got printed in bold types. The items in each sub-test were arranged in the order of difficulty value.

The test was got up in the form of a book let. Each type of test should have run over only one page. But due to the practical difficulties this could not be adhered to. Any how one and the same item was not allowed to run over two pages. To prevent fatigue and monotony the number of the items in the test was restricted to 120 and the working time of the test was 45 minutes. Except in the case of Enumeration and diagram tests, in all other cases arrangement was made to get the pupil responses only on the left side of each item. Two examples were worked out at the beginning of each test and the method of working was explained. With the help of these examples and explanation the pupils were in a positive position to answer the test comfortably. Thorndike feels that this kind of working out examples is "one of the most effective techniques for guaranteeing understanding of the test task, or for discovering and correcting misunderstanding, if it is present".¹ A scoring key was prepared so that the score may remain the same whoever scores the test. The key was pre-

1. Thorndike: "Personnel Selection", page 264.

pared in such a way that it fits in the position of the students responses on the printed test page. With the help of the key, the answers could be scored easily. The ^{test} answer book lets were got printed on a good paper. The test booklet gave an attractive look.

CHAPTER IV

Administration of the Test.

The sample.

The efficiency of an investigation depends largely on a proper selection of the sample on which the test is to be administered. The term sample is used to designate the part of a population while the whole is called the Statistical universe or Statistical population. The statistical population in this investigation is all the high school II year students of the area of the old Mysore State. As it is almost impossible for a single investigator to launch on this stupendous task, a portion of this total population was selected. The portion selected is called the sample. This sample must represent the population truly. The method of selecting the sample is called the sample design or sampling process. The quality of the investigation depends upon proper sampling. In proper sampling every individual in the statistical population will have an equal chance of selections and the sample chosen gives a correct idea about the population.

If the sampling is defective "even the best statistical technique cannot make bad data yield valid results".¹

In drawing the sample design in this investigation the total number of pupils to whom the final test^{was} to be administered

1. Garret, H.R., "Statistics in Psychology and Education", page 227.

had to be a representative of the whole group of High School II Year students, ^{from} the area of the old Mysore State. High School II Year students had to be selected, because they had studied the old syllabus, in I Year last year, and the present I Year students have a slightly, modified syllabus. The choice of schools and pupils had to be made with great care. There are many methods, of getting a representative sampling.

1. Random sampling
2. Stratified sampling
3. Area sampling
4. Accidental or uncontrolled sampling

1. Random sample.

Random sampling "does not mean, that the sample has been chosen in an off hand, careless, or haphazard fashion. Instead it means that we rely upon a certain method of selection (called 'random') to provide an unbiased cross section of the larger group or population. The criteria - for randomness in a sample are met when (1) every individual in the population or supply has the same chance of being chosen for the sample; and (2) when the selection of one individual or thing in no way influences the choice of another." ¹ Random sample can also be drawn by drawing similar and well shaken-up slips out of a hat. Random sampling is the best method of sampling. Even a systematic

1. Garret; "Statistics in Psychology and Education" page 202.

selection of an accurately listed population by taking every one fifth or every one tenth name written in an alphabetical order gives approximately a random sample.

2. Stratified - Random Sampling.

This is also called controlled sampling. It is a technique designed to ensure representativeness to avoid bias by using a modified random sampling method. It consists of two or more random samples drawn from two or more sub-divisions or strata of the total population. The different strata or sub-divisions are based upon Socio-economic status, education, skin colour, and nat^{ion}ality background.

Area Sampling.

This is a new method of designing samples. In this method the entire area is sub-divided into small sections each of which is a sampling unit, and certain of these area units are drawn at random to constitute a sample.

In this investigation the sample design was drawn according to Stratified Random sampling. The total area of the old Mysore State was studied under three strata - the urban, the rural and the industrial. Mysore and Bangalore were considered urban, Mandya, Bhadravati and K.G.F. industrial and the other parts as belonging to the rural group. Schools in the different areas mentioned above

1	2	3	4	5	6

11	<u>Taskar</u>	Govt. Boys High School	40	40	80	
12		Empress Girls High School	40	40	80	
13		Aryan High School	40	40	80	

were listed and selected by Random selection With the help of the Fisher's Table and keeping in view the number of students to be drawn into the sample from each area and the type of management i.e Government, Private and local bodies.

It was decided to draw a sample of roughly about 30 per cent from the urban area, about 10 per cent from the Industrial area and about 60 per cent from the rural area. It was decided to have 10 schools from the urban area representing different strata of society, four schools from the Industrial area and 13 schools from the rural area. This number had to be spread over schools under different managements. The number was spread as shown below.

Managements.	Urban		INDUSTRIAL		Rural		Total.
	Boys	Girls	Boys	Girls	Boys	Girls	
Government	2	2	1	.	3	1	9
Local Bodies	1		1		5		7
Private	4	1	1	1	4		11
Total	7	3	3	1	12	1	27

The schools in different areas and different management were selected by Random selection as mentioned earlier. The sample selected was distributed over the various schools as shown in the Table on page 72 (a)

Ross¹ recommends the consideration of the following questions for ensuring proper administration of the test.

1. Ross: "Measurement in To-day's schools", page 225.

1. when should the test be administered?
2. who should administer the test?
3. what is the correct procedure to follow?

1. when should the test be administered?

This test had to measure the achievement of High School II Year pupils in the first year portion of General Science. This was not taken up during the early period of the academic year as the pupils responses would not be normal and as they would be disinclined to take the examination soon after the summer holidays. The best time in the opinion of the investigator was when they were ready for the promotional examination. Therefore the last week of January was regarded the optimum period for the test to commence. The test programme commenced from the 23rd of January and it lasted till the 13th of February.

This was quite in consonance with the opinion of Ross¹ who says "There is also the fact that many studies have shown a considerable decline in knowledge at the end of summer vacation. This would seem to favour giving the test at the end of the school year when the pupils status is more normal"

2. Who should administer the test?

In the ordinary testing programme it is enough if the class room teacher administer the test. When the tests are

1. Ross: "Measurement in To-day's Schools", page 326.

used for purposes of research, or when they are used to compare one grade, class or school with ^{an} other they should be given by one person or a group of persons specially trained for this purpose. In the present investigation the investigator himself administered the test in all the schools to ensure uniformity of procedure. However the willing help of the teachers and Head Masters was made use of for the healthy conduct of the test.

3. What procedure should be followed?

Ligon¹ argues that the conditions for the test must be favourable. The test should be given in the familiar environment of the pupils own class rooms. The test should be given at regular class time without permitting to run over the lunch time or play time. He is even against having the test administered just before - or after an important event in the school like a holiday, a school party or an athletic contest. He emphasizes that unnecessary distraction and interruptions should be avoided. The words "Test going on. Please do not disturb" should be written on a card and should be hung outside the class room. The time limit should be maintained. When the test is in progress the examiner must be alert to see that pupils neither help nor hinder each other nor are distracted by external disturbances. According to Ligon² the necessary requirements of the group

1. Ligon: "Measurement in To-day's School", page 228.

2. Ibid. 230.

testing are "That all the subjects understand the instructions, that they all work throughout the assigned time at their optimum level of achievement, that they do not quit trying or omit any section of the test, that examiners - give instructions adequately and in a stimulating effective tone of voice - not a dull bored monotone - and that proctors are observing every movement of the group, stimulating lagging souls, inhibiting wandering eyes and detecting failure to instructions". However when a pupil forgets any instruction he should be permitted to raise his hand and get the necessary help.

Administration of the Test.

Programme:- The administration had to be carried according to certain programme to avoid unnecessary inconveniences and impediments in the work. A programme for conducting the test in the various schools selected was chalked out with the following details.-

Date, time and place of conducting the test and the number of students required in either of the media of instruction. A copy of the programme is found in Appendix D

Intimations were sent to the respective heads of the institutions well in time requesting them for permission - and necessary help. The letter of request contained the following details.

1. Date and time of administering the test.

2. Time required for work.

3. Number of candidates required in each medium of the class.

4. Information required about each candidate taking the test.

a) The test marks and the first terminal marks of the candidates in general science.

b) The names of 10 best and 10 worst pupils as per the estimate of the subject teachers.

A copy of the proforma is found in Appendix C.

The test was administered in January - February 1961, in all the 27 schools as per schedule.

The test was administered to 2023 students. Of this 1501 were boys and 522 were girls. The distribution of the number in English medium and Kannada medium was as follows.-

English Medium

Kannada Medium.

845

1178

The administration of the test was carried in person as already referred to. The suggestions of Ligon quoted above were kept in view and the method of motivation, directions, instructions and securing examination conditions for the test were the same as followed during the try-out. During this stage there was a slight modification in the method.

of motivation. The pupils were told that their promotional examination was fast approaching. They were informed that they had to answer a ^{new} set type of questions which are very easy and interesting. Answering ^{these} ~~revis~~ would revise the General Science portion of the previous year. The method of answering the different types of tests were explained by working out the examples given at the beginning of each type of test on the black board. Their doubts were clarified. The method of recording the answer was also explained. In short the advice of McGall "An ounce of demonstration is worth a pound of words -- probably due to primordial practice, children, not to mention adults can initiate better than they can comprehend and follow linguistic directions - - - . Demonstration has still further advantage of securing better attention especially from the young children".¹ was followed.

The students were asked to carefully fill in the blanks on the facing sheet. The directions given on the facing sheet were explained to them. The total time required for working out samples and explanation was 15 minutes. They were asked to begin at the signal "start" and "stop" answering at the signal "stop" 45 minutes were allowed for answering all the test items.

Scoring of the Test.

"The results of a test possessing scorability should

1. W.A. McGall: "Measurement", page 81.

should be obtainable in as simple, rapid, and routine a manner as is commensurate with their importance".¹ There are many methods of securing accurate scoring. In America where tests are administered to many thousands of students they make use of machine scoring. The International Test Scoring Machine scores pupils' answer sheets by means of an electrical current flowing through the lead deposited by the pupils' electrographic pencil on the answer sheet.

Hand Scoring.—

There are many types of Hand scoring keys. The strip keys, cut out stencils and transparent stencils. In this investigation the strip key method was used. Answers for each page of the test book let were written in red ink and these were pasted on a yard board sheet. The answers were spaced in such a way that they corresponded in spacing with the items of the test. Except in the case of enumeration and the diagram tests the answers were secured on the left hand side of each page in a columnar manner. The key was placed by the side of each page and the items of that page were scored.

As there is complete objectivity in scoring an objective test, even a clerk or a student can score a test as there will be no room for variation when the scoring is as per the key provided. In spite of these facilities of gett-

1. Green, Gerburich and Jorgeson: "Measurement and Evaluation in Secondary Schools", page 80.

ing the test scored by a clerk in order to avoid a re-check the investigator himself undertook the scoring of all the 2023 booklets. A score of one mark was allowed for each correct response except in the case of the enumeration and the diagram tests where a score of half a mark was given for each correct response. Each correct response was ticked off with a pencil. A cross mark was put against each wrong response.

The total number of odd and even items answered correctly were noted. The correction formula $C = R - W$ was applied to the True False Test. This was not applied to the other tests as there is difference of opinion about effecting correction to other kinds of tests. Lindquist¹ is of opinion "The frequency with which a certain wrong response is selected will depend upon the degree to which the item writer succeeded in making that response highly plausible in the light of whatever (inadequate) knowledge or ability the examinee does possess. If the item writer achieved his aim the wrong responses will always appear more plausible than the correct response to the examinee who does not possess the desired knowledge or ability" He is of opinion that the greater the number of choices per test item, the less important it is to correct for guessing.

The correct scores of each individual item were found out for calculating reliability by the method of Rational

L. Lindquist: "Educational Measurement", page 366.

equivalence.

The raw scores thus obtained were tabulated into different groups.

The scores of the pupils of various schools are given in the appendix//.

CHAPTER - V

Standardization of the Test.

Statistical Treatment:

After the tests have been scored and checked the next step is to analyse and interpret the test results. Interpretation and analysis go hand in hand. Analysis is of no use without interpretation, and interpretation is impossible without analysis. Analysis is of two types. (1) Statistical, (2) Graphical. Classification and tabulation of the data is essential for both.

In this investigation the scores were tabulated into frequency distributions of the various groups, total, urban, rural, Industrial, Boys and Girls and English and Kannada Medium, and the measures of (1) Central Tendency, (2) Measures of variability and (3) Divergence from Normality are calculated.

The results are represented graphically also. Percentile norms have been estimated. Validity and Reliability of the test are found out.

Measures of Central Tendency:-

The value of a measure of Central Tendency is two fold. It is a single measure which represents all the scores made by the group. It gives a concise description

of the performance of the group as a whole. With the help of a measure of central tendency we can compare the performance of many groups of the same standard in a field of Achievement.

The measures of central tendency for various groups have been calculated and their reliability found out. The means of the different groups have been compared and the significance of any existing difference has also been estimated.

Measures of Variability.

Having found out the measures of central tendency the spread or scatter of the separate scores around their central tendency has to be calculated. The spread or scatter around the central tendency is called variability. If a group is homogeneous, that is, made up of individuals, of nearly the same ability, most of the scores will fall around the same point on the scale, the range will be short and the variability will be small. But in a heterogeneous group there will be a wide spread of scores.

The different measures of variability for different groups have been calculated and their reliability estimated.

Measuring Divergence from Normality:

"Measurements of many natural phenomena and of many

mental and social traits under certain conditions tend to be distributed symmetrically about their means in proportions which approximate those of the normal probability distribution".¹

To find out whether our measurement is a true sample of the achievement in question of the whole population the scores obtained in a test or examination are represented in the form of a frequency polygon. After smoothing the degree of symmetry of the resulting curve is noted. A normal curve is bilaterally symmetrical about a point. The mean, mode, and median all coincide and there is perfect balance between the right half and ^{1/2} left half of the figure.

When the three measures of central tendency do not coincide, the balance or centre of gravity is shifted to one side or ² other. This appearance is termed Skewness. This is a divergence from Normality. The nature of Skewness and whether it is significant or not is found out by the two formulae - $SK = 3(\text{Mean} - \text{Median})$ and a measure of skewness in terms of percentiles.

$$SK = \frac{P_{90} + P_{10}}{2} - P_{50}$$

In this investigation the Skewness was calculated for the smoothed frequency polygons of the various groups

1. Jarret H.D. "Statistics in Psychology and Education", page 92.

and whether it is significant or not was also found out. Except in the case of the English medium group and the Rural boys group, the skewness was insignificant. That is to say there was no divergence from normality in the remaining ten groups of study. Even in the above two groups it was of a low order. The one possible explanation that can be given for this divergence being significant in the English medium group is, the language difficulty. It takes some time for pupils to understand instructions in English. As they are used to instructions in Kannada medium in the middle school a sudden change in the high school classes tells upon proper understanding of instruction.

Kurtosis.

This refers to the peakedness or flatness of a frequency distribution when compared with the normal curve. A frequency distribution which is more peaked than the normal is 'leptokurtic', one flatter than the normal 'platykurtic'. A normal distribution is mesokurtic. Scores made by small and homogeneous groups are likely to yield leptokurtic distributions; while scores from large and heterogeneous groups are more likely to be platykurtic. The kurtosis for the various groups has been calculated and its reliability determined.

Graphical representation.

Graphical representation of an educational data is a valuable supplement to statistical analysis. D. Hubbard¹ remarks "There is a magic in graphs". He describes the dynamic role of graphs as words have wings, but graphs interpret. Graphs are pure quantity stripped of verbal sham, reduced to dimension, vivid and unescapable.

The ~~findings~~^{findings} of this investigation are represented graphically. Frequency polygons have been drawn for all the groups of study. To iron out chances of irregularities and also to get a better notion of how the figure might look if the data were numerous, the frequency polygons are smoothened as per the smoothed frequencies calculated for each group given in the frequency table of the particular group. Best fitting N.P. curves have been super imposed on the frequency polygons representing three broad groups urban, rural and industrial.

The method of super imposing the best fitting normal curve of the same N, M, and SD as the actual distribution requires a little explanation. The first step is to compute the height of the maximum ordinate (y_0) or the frequency at the middle of the distribution. The maximum ordinate can be determined from the equation² of normal curve is -

-
1. D. Hubbard: "Measurement in Today's Schools", quoted by Ross, page 2347.
 2. Garret: "Statistics in Psychology and Education", page 94.

curve is $y = \frac{N}{\sigma \sqrt{2 \pi}} e^{-\frac{x^2}{2 \sigma^2}}$

in which

x = scores (expressed as deviation from the mean)
laid off along the base line or x axis

y = the height of the curve above the x axis, i.e.,
the frequency of a given x -value or the number
achieving a certain score

N = Number of cases

σ = Standard deviation of the distribution

π = 3.1416

e = 2.7183 (base of the Napierian system of
logarithms)

When x in this equation is put equal to zero (the x at the
mean of the normal curve is 0) the term $e^{-\frac{x^2}{2 \sigma^2}}$ equals

1.00 and $y_0 = \frac{N}{\sigma \sqrt{2 \pi}}$

the σ used in this equation is in interval units,
since the units on the x axis are in terms of class intervals.¹

The position of the mean for the best fitting curve
is calculated by subtracting the obtained mean of the group
from 49.5 *and marking the distance along the x axis*
~~and multiplying the result by the class interval.~~
Having calculated y_0 the other ordinates are calculated with
reference to Garret's Table B.²

1. Garret: "Statistics in Psychology and Education",
page 102.

2. Ibid, page 424.

Ordinate at	$M \pm 0.0$	$= 1000.00 \times y_0$	$= 1 \times y_0$
"	$M \pm 0.5$	$= .88250 \times y_0$	$= .88 y_0$
"	$M \pm 1.0$	$= .60653 \times y_0$	$= .61 y_0$
"	$M \pm 1.5$	$= .32465 \times y_0$	$= .32 y_0$
"	$M \pm 2.$	$= .13534 \times y_0$	$= .14 \times y_0$
"	$M \pm 2.5$	$= .04394 \times y_0$	$= .04 \times y_0$
"	$M \pm 3.0$	$= .01111 \times y_0$	$= .01 \times y_0$

The following tables give the data used for drawing the best fitting normal curves for the different groups.

A look at these curves indicates how well the smoothed frequency curves compare with the best fitting normal curves.

Ogives have also been drawn for the comparison of various groups and for calculation of the percentile norms,
in the case of the entire group

Measures of Central Tendency, Variability and DivergenceFrom Normality.

$$\begin{aligned}\text{Mean} &= A. M + J.1 \quad c = \sum fx/N = 563/2023 \\ &= 44.5 + .278 \times 10\end{aligned}$$

$$\begin{aligned}\text{Median} &= \frac{47.28}{n/2 - f} \times i \\ &= L + \frac{n/2 - f}{f_m} \times i\end{aligned}$$

$$N/2 = 2023/2 = 1011.5$$

$$f = 690$$

$$N/2 - f = 1011.5 - 690$$

$$= 321.5$$

$$L = 39.5$$

$$\begin{aligned}\text{Median} &= 39.5 + \frac{321.5}{416} \times 10 \\ &= 39.5 + 7.73 \\ &= \underline{47.23}\end{aligned}$$

Mode:- =

$$\text{Crude Mode} = 44.5$$

$$\text{True Mode} = 3 \text{ Md} - 2 \text{ Mean}$$

$$= 47.23 \times 3 - 47.28 \times 2$$

$$= 141.69 - 94.56$$

$$= \underline{47.13}$$

Quartile Deviation:-

$$\begin{aligned}
 Q_1 &= L + \frac{N/4 - F}{f_m} \times 10 & N/4 &= 2023/4 = 505.75 \\
 & & F &= 350 \\
 &= 29.5 + \frac{155.75}{340} \times 10 & N/4 - F &= 505.75 - 350 \\
 &= 29.5 + 4.58 = 34.08 & &= 155.75 \\
 & & L &= 29.5
 \end{aligned}$$

$$\begin{aligned}
 Q_3 &= L + \frac{3N/4 - F}{f_m} \times 10 & 3N/4 &= 1517.25 \\
 &= 59.5 + \frac{24.25}{312} \times 10 & F &= 1493 \\
 &= 59.5 + 0.78 & 3N/4 - F &= 1517.25 - 1493 \\
 &= 60.28 & &= 24.25
 \end{aligned}$$

$$\begin{aligned}
 Q &= \frac{Q_3 - Q_1}{2} = (60.28 - 34.08)/2 \\
 &= 26.2/2 = \underline{13.1}
 \end{aligned}$$

Mean Deviation:-

$$\begin{aligned}
 M.D &= \frac{\sum f |d|}{N} = \frac{29135.42}{2023} \\
 &= \underline{14.42}
 \end{aligned}$$

Standard Deviation:-

$$\begin{aligned}
 S.D &= 1 \times \sqrt{\frac{\sum f x^2}{N} - c^2} \\
 &= 10 \sqrt{\frac{6241}{2023} - (.28)^2} \\
 &= 10 \sqrt{3.085 - .0784} \\
 &= 10 \sqrt{3.0066} \\
 &= 10 \times 1.734 = \underline{17.34}
 \end{aligned}$$

Skewness:-

$$SK = \frac{P_{90} + P_{10}}{2} - P_{50} \quad \begin{array}{l} 10\% \text{ of } 2023 \\ = 202.3 \\ F = 98 \end{array}$$

$$P_{10} = L + \frac{202.3 - 98}{252} \times 10$$

$$= 19.5 + \frac{104.3}{252} \times 10$$

$$= 19.5 + 4.14 = 23.64$$

$$P_{90} = 69.5 + \frac{1820.7 - 1805}{175} \times 10 \quad \begin{array}{l} 90\% \text{ of } 2023 \\ = 202.3 \times 9 \\ = 1820.7 \\ F = 1805 \end{array}$$

$$= 69.5 + \frac{15.7}{175} \times 10$$

$$= 69.5 + 0.9 = 70.4$$

$$SK = \frac{1}{2} (70.4 + 23.64) - 47.23$$

$$= \frac{1}{2} \times 94.04 - 47.23$$

$$= 47.02 - 47.23 = \underline{-0.21}$$

Kartosis:-

$$Kk = Q / (P_{90} - P_{10})$$

$$= 13.1 / (70.4 - 23.64)$$

$$= 13.1 / 46.76$$

$$= \underline{0.280}$$

Reliability of Mean, Median, Standard Deviation, Percentile
Skewness and Kurtosis:

Reliability of Mean:-

$$\text{Obtained Mean} = 47.28$$

$$\sigma = 17.34$$

$$\text{S.E. of Mean or } \overline{M} = \frac{\sigma}{\sqrt{N}} = \frac{17.34}{\sqrt{2023}} = .39$$

The fiduciary probabilities is 0.95 *hal*.
the true mean lies in the interval

$$M \pm 1.96 \sigma_M \text{ or } M \pm 1.96 \times .39$$

$$\text{or } 47.28 \pm 0.76 \text{ or } 46.52 \text{ and } 48.04$$

$$\text{The true mean lies between } M \pm 2.58 \sigma_M \text{ or}$$

$$47.28 \pm 2.58 \times .39 \text{ or } 47.28 \pm 1.0$$

or 46.28 and 48.28 at the .01 level of confidence.

Therefore the sample mean of 47.28 with the S.E. of 0.39 is highly stable and deserving of great confidence.

Median:-

$$\text{S.E. of Median} = \sigma_{Mdn} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 17.34}{\sqrt{2023}}$$

$$= 21.727/45 = .48$$

Therefore the true median lies between $47.23 \pm 1.96 \times .48$ at .05 level and between $47.23 \pm 2.58 \times .48$ at .01 level of confidence i.e. between 47.23 ± 0.94 and 47.23 ± 1.24 . This narrow range indicates high stability in the computed median.

Standard Deviation:-

$$S.E \quad \text{or} \quad \sigma = \frac{.716}{\sqrt{N}} = \frac{.71 \times 17.34}{\sqrt{2023}} = 0.27$$

Therefore the limits of accuracy are

$$17.34 \pm 1.96 \times .27 \quad \text{or} \quad 17.34 \pm 0.53$$

or 16.81 and 17.87 at .95 confidence level

$$\text{and } 17.34 \pm 2.58 \times .27 \quad \text{or} \quad 17.34 \pm .70$$

or 16.64 and 18.04 at .99 confidence level.

Skewness:-

S.F. of Percentile Skewness:-

$$\sigma_{SK} = \frac{0.5185 D}{\sqrt{N}}, \quad \text{where } D = P_{90} - P_{10}$$

$$= 0.5185 \times 46.76 / \sqrt{2023} \quad P_{90} = 70.40$$

$$= .54 \quad P_{10} = 23.64$$

Therefore D = 46.76

The deviation from the normal in this sample

is - 0.21 Dividing this by 0.54, we get the critical ratio

$$\text{i.e. G.R} = \frac{-0.21}{.54} = \frac{-.21}{.54}$$

$$= -0.39$$

$$= -.39$$

This is far short of 1.96 at .05 and of 2.58 at .01 confidence levels of significance. Hence the obtained skewness of -0.21 is quite negligible and the distribution is almost perfectly symmetrical.

Kurtosis:-

Obtained Kurtosis = 0.28

This deviates from 0.263 for the normal by

$.28 - .263 = 0.017$ which shows that the distribution tends to be platykurtic.

$$\begin{aligned} \text{SE of the percentile measure of Kurtosis} &= \sigma_{\tilde{K}_u} = \frac{.28}{\sqrt{N}} \\ &= \sigma_{\tilde{K}_u} = \sqrt{\frac{.28}{2023}} = 0.006 \end{aligned}$$

Therefore $Z.R = \frac{.017}{.006} = 2.83$ which is greater

than 2.58 at the .01 confidence level and still greater

than 1.96 at .05 confidence level. Hence the distribu-

tion is really more flattened than the normal. This is

explained by the fact that there is a wide distribution of

cases in the middle range - $Q = 13.1$

Frequency Distribution - Rural

Σfx² = 2614

Σ(f) d² = 12564.23

Measures of Central Tendency, Variability and Divergence from Normality.

The methods of calculating these measures were the same as followed in the previous case.

Mean	=	<u>47.17</u>
Median	=	<u>47.64</u>
Mode	=	<u>48.58</u>
Quartile Deviation.	=	<u>12.94</u>
Mean Deviation	=	<u>14.10</u>
Standard Deviation	=	<u>16.91</u>
Skewness in Terms of Percentiles	=	<u>-1.42</u>
Kurtosis	=	<u>0.285</u>

Reliability of the above five measures Mean, Median, Skewness, Kurtosis and Standard Deviation.

Mean:-

$$O_M = \frac{O}{\sqrt{N}} = \frac{16.91}{\sqrt{891}} = 0.5665$$

Therefore the limits of accuracy with in which the True Mean falls are $47.17 \pm 1.96 \times .5665$, i.e. 47.17 ± 1.11 i.e. 46.06 and 48.28 at the .05 confidence level and $47.17 \pm 2.58 \times .5665$ i.e. 47.17 ± 1.46 or 45.71 and 48.63 at .01 confidence level of significance.

Median:-

$$\begin{aligned}
 J_{\text{Med}} &= \frac{1.253 \sigma}{\sqrt{N}} \\
 &= \frac{1.253 \times 16.91}{\sqrt{891}} \\
 &= 0.7098
 \end{aligned}$$

Therefore the limits of accuracy for the True Median are $17.64 \pm 1.96 \times .7098$ or 17.64 ± 1.39 or 16.25 or and 19.03 at .05 confidence level and $17.64 \pm 2.58 \times .7098$ at .01 confidence level.

Standard Deviation:-

$$\begin{aligned}
 J_{\text{S.D.}} &= \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 16.91}{\sqrt{891}} \\
 &= 0.4023
 \end{aligned}$$

Therefore the True S.D. lies between $16.91 \pm 1.96 \times .4023$ i.e. 16.91 ± 0.79 or 16.12 and 17.70 at .05 level of significance and between $16.91 \pm 2.58 \times .4023$ or 16.91 ± 0.0161 is 16.39 and 18.93 at the .01 level of significance.

Skewness:-

$$\text{Obtained Skewness} = -1.42$$

$$\begin{aligned}
 J_{\text{Sk}} &= \frac{0.5185 D}{\sqrt{N}} \quad \text{Where } D = P_{90} - P_{10} = 45.42 \\
 &= \frac{0.5185 \times 45.42}{\sqrt{891}} = 0.7884
 \end{aligned}$$

Therefore G.R. = $\frac{-1.42}{.7884} = -1.12$ which is well with in

the 1.96 level of confidence and much below the 2.58 level of significance. Hence the obtained Skewness of - 1.42 is not significant and the distribution does not deviate from the normal to any great extent.

Kurtosis:-

Obtained Ku = 0.285

Therefore the deviation from the normal

= 0.285 - 0.263 = 0.022, the positive sign indicating a tendency to be platy kurtic.

$$\sigma_{Ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{891}} = 0.00938$$

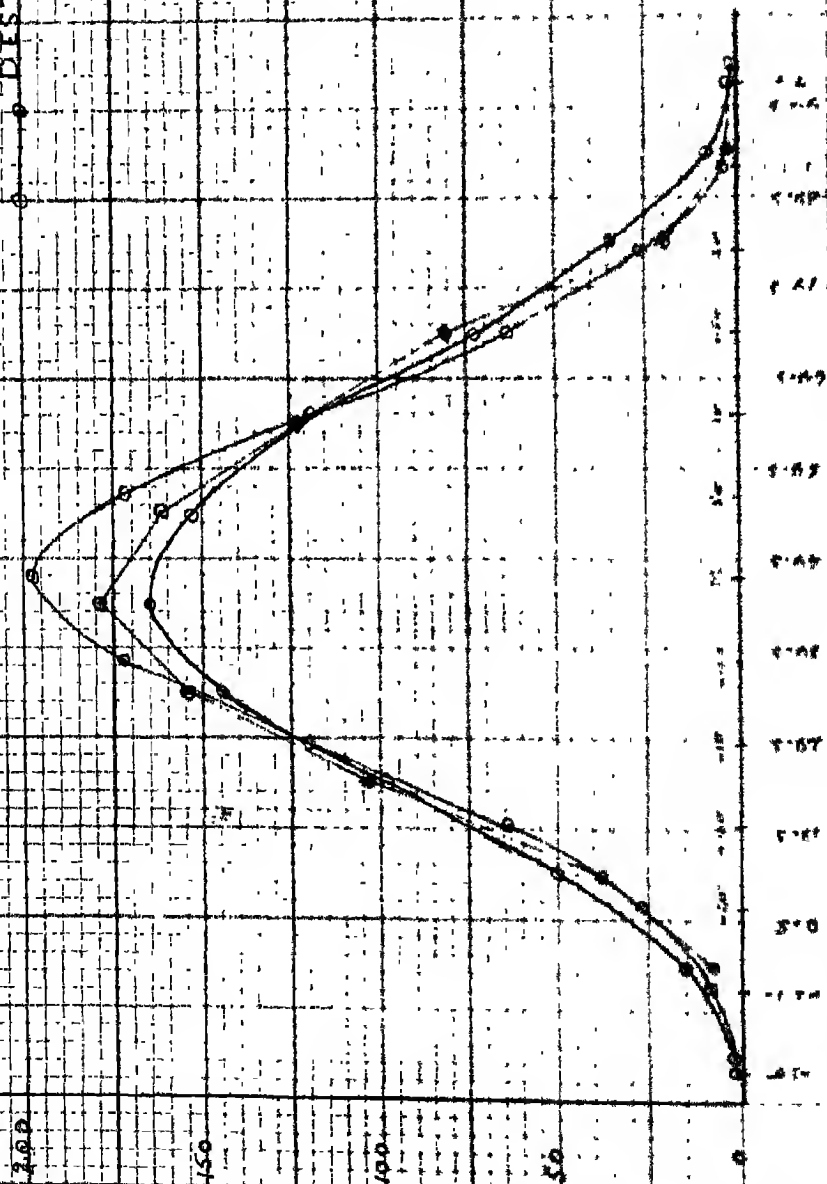

$$\text{Therefore J.K.} = \frac{0.022}{.00938} = 2.345 = 2.34$$

which is greater than 1.96 but less than 2.58. Hence the Kurtosis is significant at the .05 level but not at the .01 level of confidence.

N = 866

$\sum fx = 231$

$\sum fx^2 = 2776$

$\sum f d = 12646.32$

0.7 1.0

Measures of Central Tendency, Variability and Divergence from Normality.

Mean	=	<u>47.17</u>
Median	=	<u>46.82</u>
Mode	=	<u>46.12</u>
Quartile Deviation	=	<u>13.09</u>
Mean Deviation	=	<u>14.6</u>
Standard Deviation	=	<u>17.49</u>
Skewness in Terms of Percentiles	=	<u>0.71</u>
Kurtosis	=	<u>0.273</u>

Reliability of the Mean, Median, Standard Deviation, Skewness and Kurtosis.

Mean:-

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{17.49}{\sqrt{866}} = 0.594$$

Therefore the obtained Mean being 47.17, the True Mean lies between $47.17 \pm 1.96 \times 0.594$ i.e. 46.00 and 48.34 at .05 level and between $47.17 \pm 2.58 \times .594$ i.e. 45.64 and 48.80 at the .01 level of confidence.

Median:-

$$\sigma_{Min} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 17.49}{\sqrt{866}} = 0.9404.$$

Therefore the limits of accuracy for the True Median at 0.05 level of significance are $46.82 \pm 1.96 \times .9404$ i.e. 45.36 and 48.28 and at .01 level of significance

are $46.82 \pm 2.58 \times 0.9404$ i.e. 44.9 and 48.74

Standard Deviation:-

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 17.49}{\sqrt{866}} = 0.4219$$

Therefore the True SD lies between $17.49 \pm 1.96 \times .4219$ i.e. 16.66 and 18.32 at the .05 level of confidence and between $17.49 \pm 2.58 \times .4219$ or 16.4 and 18.58 at the .01 level of significance.

Percentile Skewness:-

$$\begin{aligned} \overline{OSK} &= \frac{0.5185 D}{\sqrt{N}} = \frac{.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 47.98}{\sqrt{866}} \\ &= 0.967 \end{aligned}$$

The obtained skewness $SK = 0.71$. Hence $C.R =$

$$\frac{0.71}{0.967} = 0.84 \text{ which is far below } 1.96 \text{ and still}$$

farther below 2.58 at the .05 and .01 levels of significance. Hence the skewness is negligible and the distribution is almost normal.

Kurtosis:-

$$\overline{OKu} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{866}} = 0.009515$$

The deviation from the normal $= 0.273 - 0.263$
 $= 0.01.$

$$\text{Therefore } C.R = \frac{0.01}{.0095} = 1.05.$$

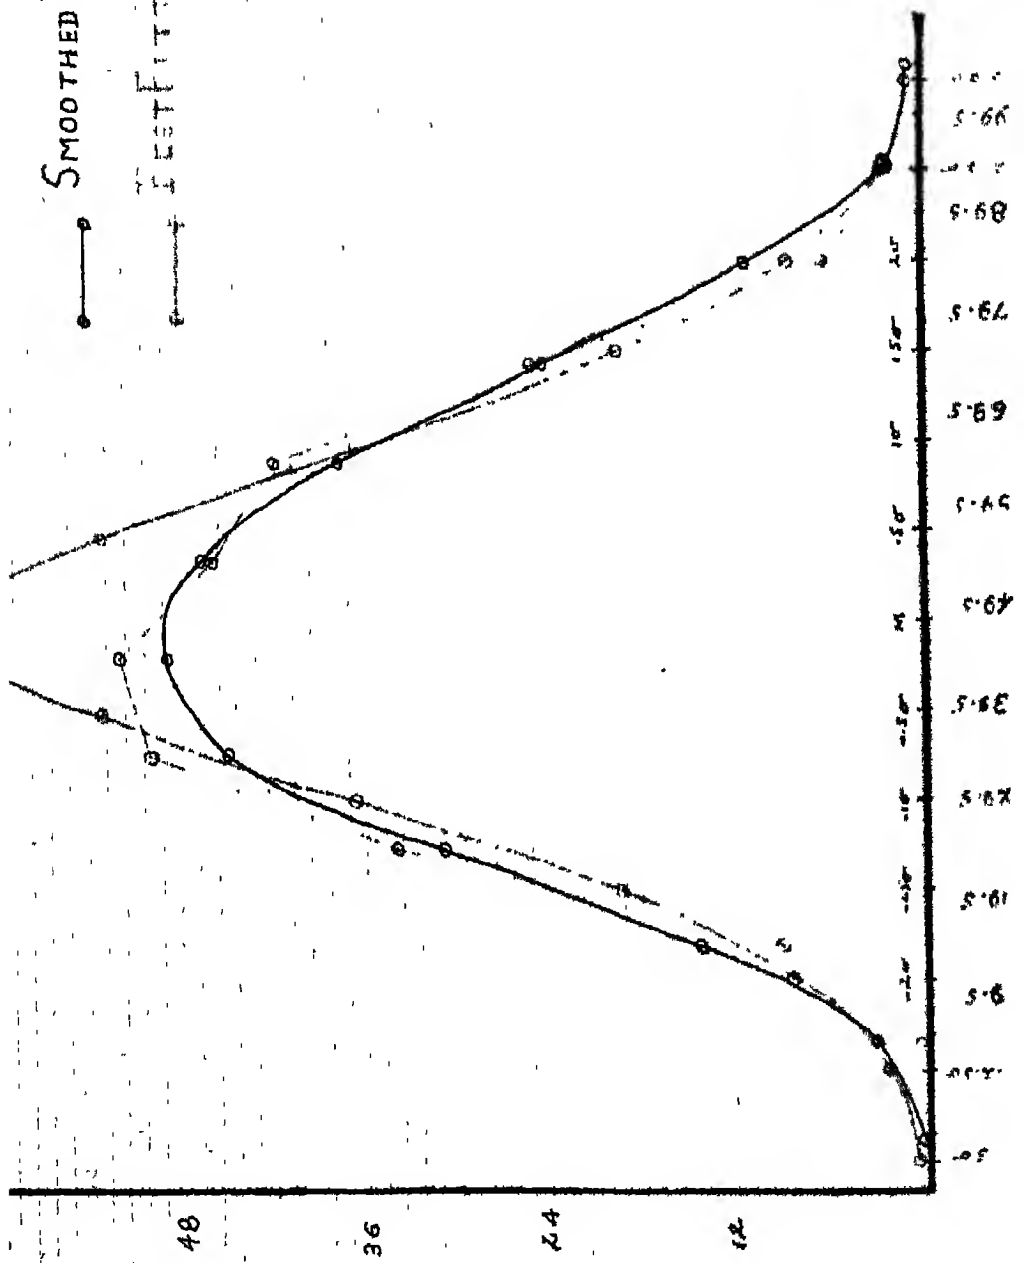

This being well within 1.96 and far below 2.58
the distribution is no more flat than the normal.

N=266

$\sum fx = 94$

$\sum fx^2 = 852$

$\sum f \mid d \mid = 3924.72$

Measures of Central Tendency, Variability and Divergence from Normality.

Mean	=	<u>48.03</u>
Median	=	<u>47.19</u>
Mode	=	<u>45.51</u>
quartile Deviation	=	<u>13.66</u>
Mean Deviation	=	<u>14.75</u>
Standard Deviation	=	<u>17.55</u>
Skewness in Terms of Percentiles	=	<u>1.18</u>
Kurtosis	=	<u>0.288</u>

Reliability of Mean, Median, Standard Deviation, Skewness and Kurtosis.

Mean:-

$$\sigma_{\bar{M}} = \frac{\sigma}{\sqrt{N}} = \frac{17.55}{\sqrt{266}} = 1.076$$

Therefore at the 0.05 level of significance the True Mean lies between $48.03 \pm 1.96 \times 1.076$ i.e. 45.92 and 50.14. And at the 0.01 level between $48.03 \pm 2.58 \times 1.076$ i.e. 45.25 and 50.81

Median:-

$$\begin{aligned} \sigma_{\bar{Mdn}} &= \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 17.55}{\sqrt{266}} \\ &= 1.348. \end{aligned}$$

Therefore True Median lies between $47.19 \pm 1.96 \times 1.348$

i.e. 44.55 and 49.83 at 0.05 level and between $47.19 \pm 2.58 \times 1.348$ i.e. 43.71 and 50.67 at 0.01 level of significance.

Standard Deviation:-

$$\sigma_s = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 17.55}{\sqrt{266}} = 0.7638$$

Therefore the limits of accuracy for the True SD are $17.55 \pm 1.96 \times .7638$ i.e. 16.05 and 19.05 at 0.05 level and between $17.55 \pm 2.58 \times .7638$ i.e. 15.68 and 19.52 at 0.01 level of significance.

Skewness:-

$$\begin{aligned} \sigma_{SK} &= \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 47.38}{\sqrt{266}} = 1.506 \end{aligned}$$

The obtained skewness is 1.18

Therefore C.R = $\frac{1.18}{1.506} = 0.9513$ which is far below

1.96 or 2.58, the 0.05 and 0.01 levels of significance

Hence the skewness is negligible and the distribution is almost normal.

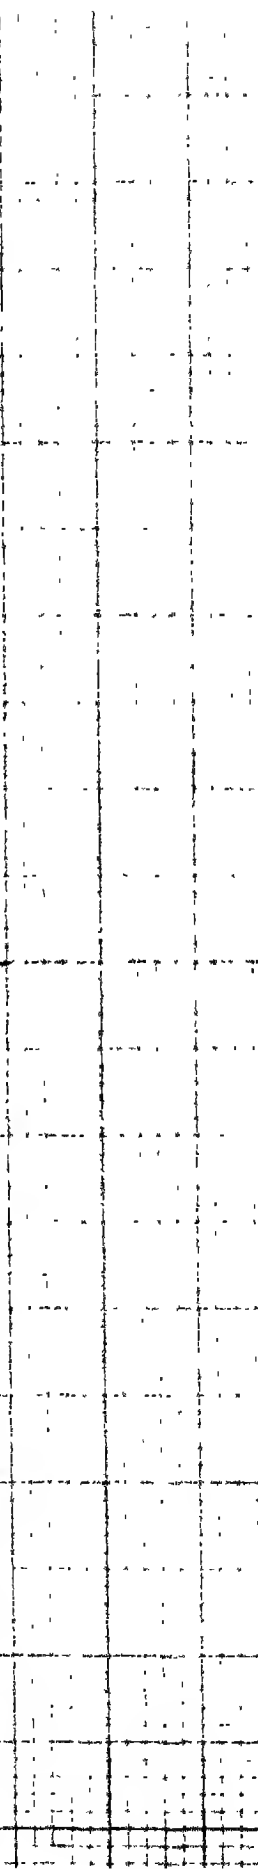

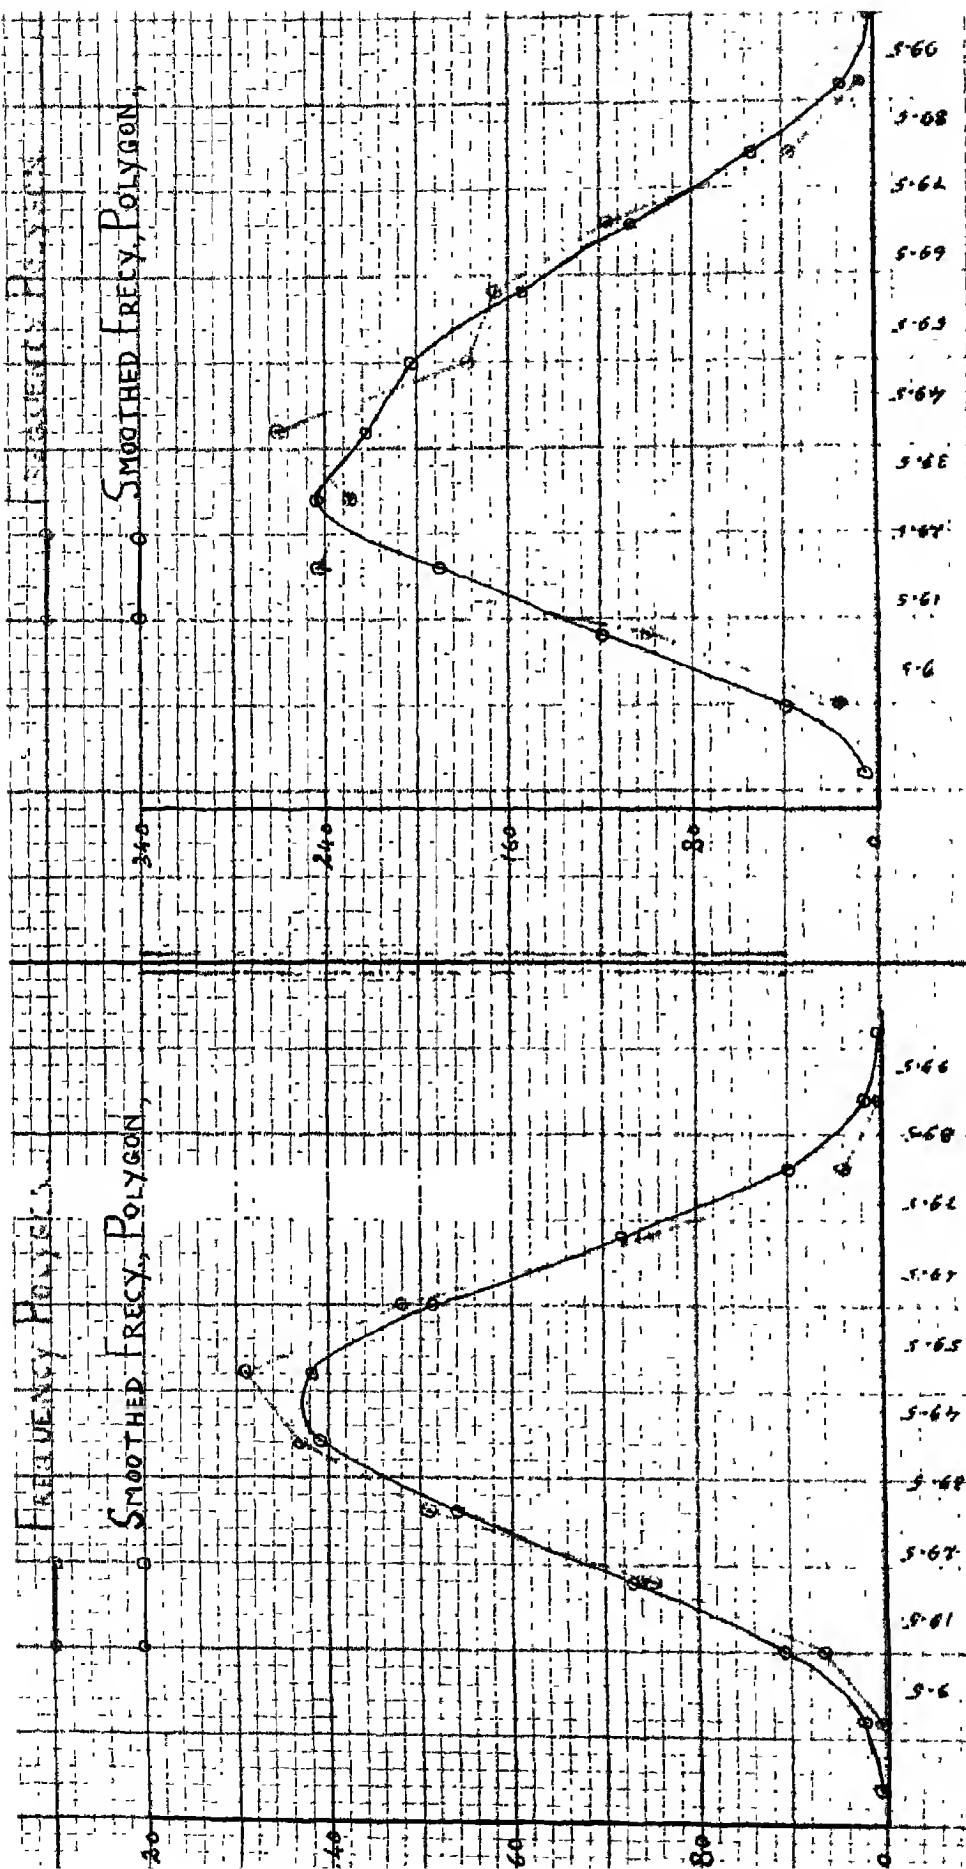

Kurtosis:-

$$\sigma_{ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{266}} = 0.0171$$

The obtained deviation from the normal = $0.288 - .263 = 0.025$.

$$\text{Therefore C.R} = \frac{0.025}{0.0171} = 1.46 \text{ which is well}$$

within 1.96 and 2.58 at the 0.05 and 0.01 levels of confidence. Hence the platykurtosis of the distribution is not of any significance. The distribution is almost mesokurtic.

		0						0	0.0	0.3	0.09

N=1178

$\sum fx = -592$ $\sum fx^2 = 3186$

$\sum f i d i = 15250.78$

Measures of Central Tendency, Variability and Divergence from Normality:

Mean	=	<u>49.47</u>
Median	=	<u>49.97</u>
Mode	=	<u>50.97</u>
Quartile Deviation	=	<u>11.48</u>
Mean Deviation	=	<u>12.95</u>
Standard Deviation	=	<u>15.50</u>
Skewness in Terms of Percentiles	=	<u>-0.885</u>
Kurtosis	=	<u>0.281</u>

Reliability of Mean, Median, Standard deviation, and Skewness and Kurtosis:

Mean:-

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{15.50}{\sqrt{1178}} = 0.4516$$

Limits of accuracy of the True Mean = $49.47 \pm 1.96 \times .4516$ i.e. 48.58 and 50.36 at 0.05 level and $49.47 \pm 2.58 \times .4516$ i.e. 48.30 and 50.64 at 0.01 level of confidence.

Median:-

$$\sigma_{Mdn} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 15.50}{\sqrt{1178}} = 0.5657$$

Hence True Median lies between $49.97 \pm 1.96 \times .5657$

that is 48.86 and 51.08 at 0.05 level and between $49.97 \pm 2.58 \times .5657$ or 48.51 and 51.43 at 0.01 level of confidence.

Standard Deviation:-

$$\sigma = \frac{0.71 D}{\sqrt{N}} = \frac{0.71 \times 15.5}{\sqrt{1178}} = 0.3206$$

Hence the population SD lies between $15.5 \pm 1.96 \times .3206$ i.e. 14.87 and 16.13 at 0.05 level and between $15.5 \pm 2.58 \times .3206$ or 14.67 and 16.33 at 0.01 level of significance.

Skewness:-

$$\begin{aligned} g_{sk} &= \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 40.87}{\sqrt{1178}} = 0.6175 \end{aligned}$$

Therefore C.R = $\frac{-0.885}{0.6175} = -1.43$. This value is well

within 1.96 at 0.05 level and 2.58 at 0.01 level of confidence. Hence the obtained skewness of -0.885 does not indicate any significant divergence from the normal.

Kurtosis:-

$$\sigma_{Ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{1178}} \\ = 0.009598$$

$$\text{Therefore } J.R = \frac{0.281 - .263}{0.009598} = \frac{0.018}{0.009598} \\ = 2.21$$

2.21 is greater than 1.96 but less than 2.58.

Hence the platy kurtosis is significant at the ~~0.01~~ 0.05 level but insignificant at the 0.01 level.

Frequency Distribution - English Medium

	4.5	0						0	0.0	3.3	0.40

$\sum fx = -23$
 $\sum fx^2 = 3121$
 $\sum f |d| = 13259.97$

$N = 845$

Measures of Central Tendency, Variability and Divergence from Normality.

Mean	=	<u>44.23</u>
Median	=	<u>42.9</u>
Mode	=	<u>40.24</u>
Quartile Deviation	=	<u>15.09</u>
Mean Deviation	=	<u>15.69</u>
Standard Deviation	=	<u>19.2</u>
Skewness in Terms of Percentiles	=	<u>3.07</u>
Kurtosis	=	<u>0.294</u>

Reliability of Mean, Median, Standard Deviation, Skewness and Kurtosis.

Reliability of Mean:-

$$O_M = \frac{\sigma}{\sqrt{N}} = \frac{19.2}{\sqrt{845}} = 0.6604$$

True Mean lies between $44.23 \pm 1.96 \times .6604$ that is 42.94 and 45.52 at 0.05 level of confidence and between $44.23 \pm 2.58 \times .6604$ i.e. 42.53 and 45.93 at the 0.01 level of confidence.

Reliability of Median:-

$$O_{Mdn} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 19.2}{\sqrt{845}} = 0.8273$$

Hence the limits of accuracy for the True Median are $42.9 \pm 1.96 \times .8273$ or 41.28 and 44.52 at the 0.05 level of confidence and $42.9 \pm 2.58 \times 0.8273$ or 40.77 and 45.03 at the 0.01 level of confidence.

Reliability of S.D.

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 19.2}{\sqrt{845}} = 0.4689$$

Hence the population SD lies between $19.2 \pm 1.96 \times 0.4689$
 or 18.28 and 20.12 at 0.05 level
 and -do- $19.2 \pm 2.58 \times 0.4689$ at 0.01 level

Reliability of Skewness:

$$\sigma_{SK} = \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{845}} = \frac{0.5185 \times 51.3}{\sqrt{845}} = 0.9828$$

$$\text{Therefore C.R} = \frac{3.07}{0.9828} = 3.36$$

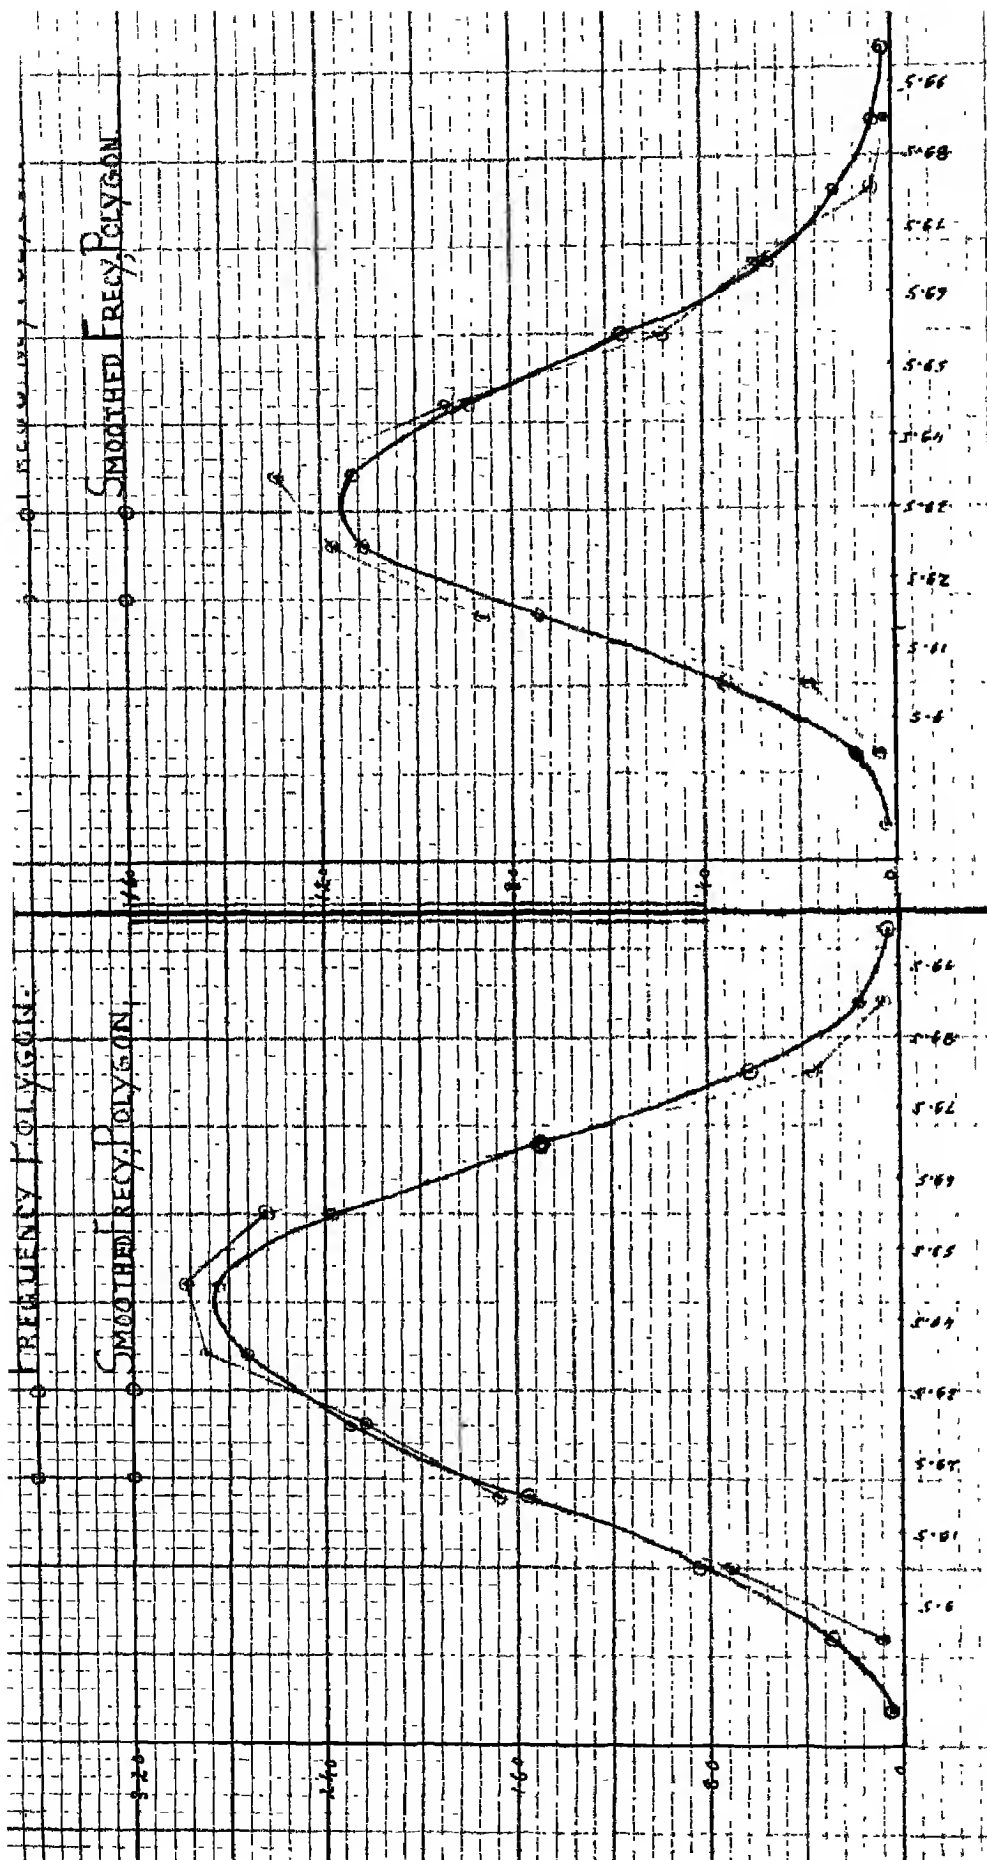

3.36 is outside 1.96 and 2.58 at the 0.05 and 0.01 levels of confidence. Hence the distribution shows a significance divergence from the normal and is positively skewed with the scores massing at the low end of the scale.

Reliability of Kurtosis:-

$$\sigma_{Ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{845}} = 0.009632$$

$$\text{Therefore C.R} = \frac{0.294 - 0.263}{0.009632} = 3.219$$

3.219 is greater than 1.96 at 0.05 level of confidence and -do- 2.58 at 0.01 do
 Hence the platy Kurtosis of the distribution is significant. This is explained by the wide distribution of scores in the middle range. ($q = 15.09$)

Frequency Distribution - Boys

0-9	4.5	7	-5	-35	175	44.18	309.26	7	0.5	25.3	1.9	
		0						0	0.0	2.3	0.17	

N = 1501

$\Sigma fx = -873$

$\Sigma fx^2 = 5213$

$\Sigma \left(\frac{1}{d} \right) = 22245.98$

Measures of Central Tendency, Variability and Divergence from Normality:

Mean	=	<u>48.68</u>
Median	=	<u>49.31</u>
Mode	=	<u>50.57</u>
Quartile Deviation	=	<u>13.48</u>
Mean Deviation	=	<u>14.82</u>
Standard Deviation	=	<u>17.71</u>
Skewness in Terms of Percentile	=	<u>-1.4</u>
Kurtosis	=	<u>0.281</u>

Reliability of Mean, Median, Standard Deviation, Skewness and Kurtosis:-

Reliability of Mean:

$$\sigma_{\bar{M}} = \frac{\sigma}{\sqrt{N}} = \frac{17.71}{\sqrt{1501}} = 0.4571$$

Therefore the True Mean ^{lies between} $48.68 \pm 1.96 \times .4571$ or 47.78 & 49.58
at 0.05 level

and - do- $48.68 \pm 2.58 \times .4571$ or 47.50 & 49.86
at 0.01 level

Reliability of Median:-

$$\sigma_{\bar{Mdn}} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 17.71}{\sqrt{1501}} = 0.5727$$

Therefore the T.M. lies between $49.31 \pm 1.96 \times 0.5727$
or 48.19 and 50.43
at 0.05 level

and - do - $49.31 \pm 2.58 \times .5727$
or 47.83 & 50.79
at 0.01 level

Reliability of SD:

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 17.71}{\sqrt{1501}} = 0.3245$$

Therefore the T. SD lies between $17.71 \pm 1.96 \times .3245$
or 17.07 & 18.35
at 0.05 level

and -do - $17.71 \pm 2.58 \times .3245$
or 16.87 & 18.55
at 0.01 level

Reliability of Skewness:

$$\begin{aligned} \sigma_{SK} &= \frac{.5185 D}{\sqrt{N}} = \frac{.5185 (P_{90} - P_{10})}{\sqrt{1501}} \\ &= \frac{.5185 \times 48.06}{\sqrt{1501}} = 0.6430 \end{aligned}$$

$$C.R = \frac{-1.4}{0.6430} = -2.18$$

- 2.18 is greater than 1.96 at 0.05 level

do less than 2.58 at 0.01 level

Hence the divergence is significant at the .05 level but not so at the .01 level of confidence.

Reliability of Kurtosis:

$$\sigma_{Ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{1501}} = .0072$$

$$C.R = \frac{(0.281 - 0.263)}{.0072} = \frac{0.018}{.0072} = 2.49$$

2.49 is greater than 1.96 but less than 2.58. Hence the platy kurtosis is significant at 0.05 level but insignificant at 0.01 level of confidence.

Frequency Distribution - Girls

N = 522

$\Sigma fx = -65$

$\Sigma fx^2 = 1273$

$\Sigma f |d| = 6220.00$

Measures of Central Tendency, Variability and Divergency from Normality.

Mean	=	<u>43.25</u>
Median	=	<u>42.55</u>
Mode	=	<u>41.15</u>
Quartile Deviation	=	<u>11.2</u>
Mean Deviation	=	<u>11.92</u>
Standard Deviation	=	<u>15.56</u>
Skewness in Terms of Percentiles	=	<u>1.68</u>
Kurtosis	=	<u>0.266</u>

Reliability of Mean, Median, Standard Deviation, Skewness and Kurtosis:

Reliability of Mean:

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{15.56}{\sqrt{522}} = 0.6870$$

the T.M. lies between $43.25 \pm 1.96 \times .6870$ or 41.91 & 44.59
at 0.05 level

and do $43.25 \pm 2.58 \times .6870$ or 41.49 & 45.01
at 0.01 level

Reliability of Median:-

$$\sigma_{Min} = \frac{1.253\sigma}{\sqrt{N}} = \frac{1.253 \times 15.56}{\sqrt{522}} = 0.8531$$

T.Min lies between $42.55 \pm 1.96 \times 0.8531$ or 40.88 & 44.22
at 0.05 level

and do $42.55 \pm 2.58 \times .8531$ or 40.35 & 44.75
at 0.01 level

Reliability of SD:

$$O_D = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 15.56}{\sqrt{522}} = 0.4835$$

T.SD lies between $15.56 \pm 1.96 \times .4835$ or 14.61 & 16.51
at 0.05 level

and -do $15.56 \pm 2.58 \times 0.4835$ or 14.31 & 16.81
at 0.01 level

Reliability of Skewness:

$$O_{ST} = \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}}$$

$$= \frac{0.5185 \times 42.13}{\sqrt{522}} = 0.9559$$

$$T.R = \frac{1.68}{0.9559} = 1.76$$

1.76 is less than 1.96 at 0.05 level

do 2.58 at 0.01 level

Hence the skewness of 1.68 is not significant at both the levels of confidence.

Reliability of Kurtosis:

$$O_{Kd} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{522}} = 0.0122$$

$$C.R = \frac{(0.286 - 0.283)}{0.0122} = \frac{0.003}{0.0122}$$

$$= 0.245$$

0.245 is far below 1.96 and 2.58 at both the levels of confidence. Hence the distribution has no divergence from the normal.

$$N = 727 \quad \sum fx = 237 \quad \sum fx^2 = 2253 \quad \sum fMd = 10631.50$$

Measures of Central Tendency, Variability and Divergence
from Normality:

Mean	=	<u>47.76</u>
Median	=	<u>48.64</u>
Mode	=	50.40
Quartile Deviation	=	<u>13.34</u>
Mean Deviation	=	<u>14.49</u>
Standard Deviation	=	<u>17.86</u>
Skewness in Terms of Percentiles	=	<u>-2.73</u>
Kurtosis	=	<u>0.284</u>

Reliability of Mean, Median, Standard Deviation, Skewness
and Kurtosis:

Reliability of Mean:

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{17.86}{\sqrt{727}} = .6625$$

the T.M. lies between $47.76 \pm 1.96 \times .6625$ or 46.46 & 49.05
at 0.05 level

and -do- $47.76 \pm 2.58 \times .6625$ or 46.05 & 49.47
at 0.01 level

Reliability of Median:-

$$\sigma_{Mdn} = \frac{1.253}{\sqrt{N}} = \frac{1.253 \times 17.86}{\sqrt{727}} = 0.8301$$

T.Mdn lies between $48.64 \pm 1.96 \times 0.8301$ or 47.01 & 50.27
at 0.05 level

and do $48.64 \pm 2.58 \times 0.8301$ or 46.50 & 50.78
at 0.01 level

Reliability of SD:

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 17.86}{\sqrt{727}} = 0.4704$$

T.SD lies between $17.86 \pm 1.96 \times 0.4704$ or 18.94 ± 18.78
at 0.05 level

and -do- $17.86 \pm 2.58 \times .4704$ or 18.65 ± 19.07
at 0.01 level

Reliability of Skewness:

$$\begin{aligned} \sigma_{SK} &= \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 46.93}{\sqrt{727}} = 0.9802 \end{aligned}$$

$$C.R = \frac{-2.73}{0.9802} = -3.03$$

- 3.03 is greater than ± 1.96 at 0.05 level
do 2.58 at 0.01 level

Hence the distribution shows a significant divergence from the normal on the negative side.

Reliability of Kurtosis:

$$\begin{aligned} \sigma_{Ku} &= \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{727}} = 0.0103 \\ C.R &= \frac{(0.284 - .263)}{0.01039} = \frac{0.021}{0.01039} = 2.214 \end{aligned}$$

2.214 is greater than 1.96 at 0.05 level

and do less than 2.58 at 0.01 level. Hence

the Kurtosis is significant at 0.05 level but insignificant at 0.01 level.

Frequency Distribution - Boys - Urban

N = 578

$\sum fx = 288$
 $\sum fx^2 = 1986$

$\sum f | d | c.f = 11430$

Measures of Central Tendency, Variability and Divergence
from Normality:

Mean	=	<u>49.5</u>
Median	=	<u>49.93</u>
Mode	=	<u>50.79</u>
Quartile Deviation	=	<u>13.34</u>
Mean Deviation	=	<u>19.78</u>
Standard Deviation	=	<u>17.86</u>
Skewness in terms of Percentiles	=	<u>-0.68</u>
Kurtosis	=	<u>0.275</u>

Reliability of Mean, Median, Standard Deviation, Skewness
and Kurtosis:

Reliability of Mean:

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{17.86}{\sqrt{578}} = 0.7429$$

the T.M. lies between $49.5 \pm 1.96 \times 0.7429$ or 48.04 & 50.96
 at 0.05 level
 and -do- $49.5 \pm 2.58 \times 0.7429$ or 47.58 & 51.42
 at 0.01 level

Reliability of Median:-

$$\sigma_{Mdn} = \frac{1.253\sigma}{\sqrt{N}} = \frac{1.253 \times 17.86}{\sqrt{578}} = 0.9863$$

T.Mdn lies between $49.93 \pm 1.96 \times 0.9863$ or 48.03 & 51.83
 at 0.05 level
 and do $49.93 \pm 2.58 \times 0.9863$ or 47.53 & 52.33
 at 0.01 level

Reliability of SD:

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 17.86}{\sqrt{578}} = 0.5274$$

T.SD lies between $17.86 \pm 1.96 \times 0.5274$ or 16.83 ± 18.89
at 0.05 level

and -do- $17.86 \pm 2.58 \times 0.5274$ or 16.60 ± 19.22
at 0.01 level

Reliability of Skewness:

$$\begin{aligned} \sigma_{SK} &= \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 48.55}{\sqrt{578}} = 1.047 \end{aligned}$$

$$J.R = \frac{-.68}{1.047} = 0.91$$

0.91 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level

Hence the skewness is negligible and the distribution is almost normal.

Reliability of Kurtosis:

$$\sigma_{Ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{578}} = 0.0116$$

$$J.R = \frac{(0.275 - 0.263)}{0.0116} = \frac{0.012}{0.0116} = 1.03$$

1.03 is less than 1.96 at 0.05 level

and do less than 2.58 at 0.01 level. Hence the platy kurtosis is negligible at both levels of confidence and the distribution does not deviate from the normal to any significant extent.

Mean Deviation	=	<u>18.68</u>
Standard Deviation	=	<u>18.52</u>
Skewness in Terms of Percentiles	=	<u>-0.66</u>
Kurtosis	=	<u>0.29</u>

Reliability of Mean, Median, Standard Deviation,
Skewness and Kurtosis:

Reliability of Mean:-

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{18.52}{\sqrt{196}} = 1.323$$

the T.M. lies between $49.65 \pm 1.96 \times 1.323$ or 47.06 & 52.25
at 0.05 level

and -do- $49.65 \pm 2.58 \times 1.323$ or 46.24 & 53.06
at 0.01 level

Reliability of Median:-

$$\sigma_{Mdn} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 18.52}{\sqrt{196}} = 1.658$$

T.Mdn lies between $50.07 \pm 1.96 \times 1.658$ or 46.72 & 53.32
at 0.05 level

and do $50.07 \pm 2.58 \times 1.658$ or 45.79 & 54.35
at 0.01 level

Reliability of SD:

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 18.52}{\sqrt{196}} = 0.9393$$

T.SD lies between $18.52 \pm 1.96 \times 0.9393$ or 16.98 & 20.36
at 0.05 level

and -do- $18.52 \pm 2.58 \times 0.9393$ or 16.09 & 20.95
at 0.01 level

Reliability of Skewness:

$$\begin{aligned} \sigma_{g_1} &= \frac{0.5185 \sigma}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 50.27}{\sqrt{196}} = 1.862 \end{aligned}$$

$$Z.R = \frac{-.66}{1.862} = 0.3545$$

0.3545 is far below 1.96 at 0.05 level

and do 2.58 at 0.01 level

Hence the skewness is not significant.

Reliability of Kurtosis:

$$\sigma_{K_u} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{196}} = .02$$

$$Z.R = \frac{(0.29 - .263)}{0.02} = \frac{0.027}{0.02} = 1.35$$

1.35 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level. Hence the

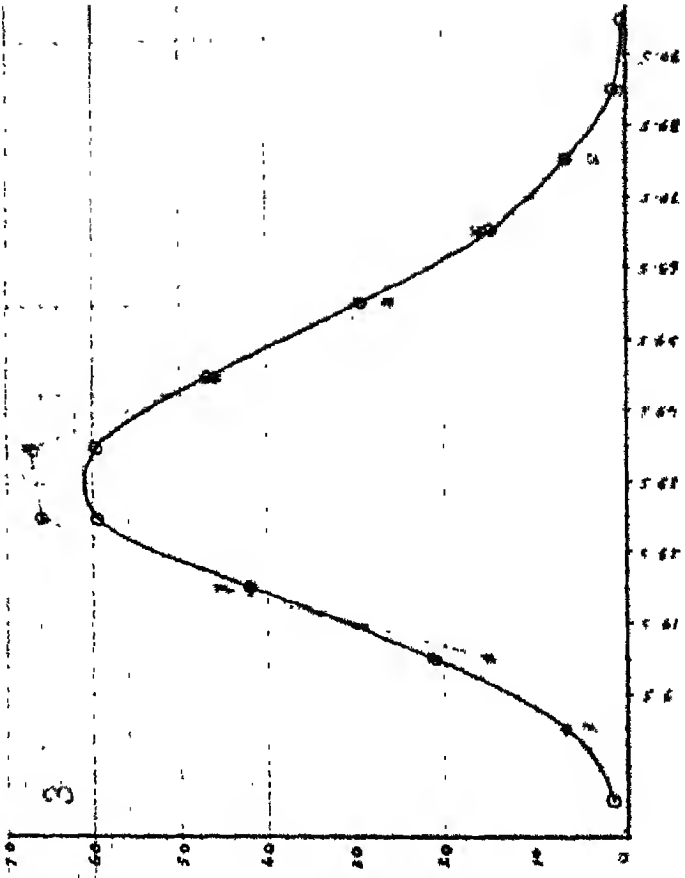

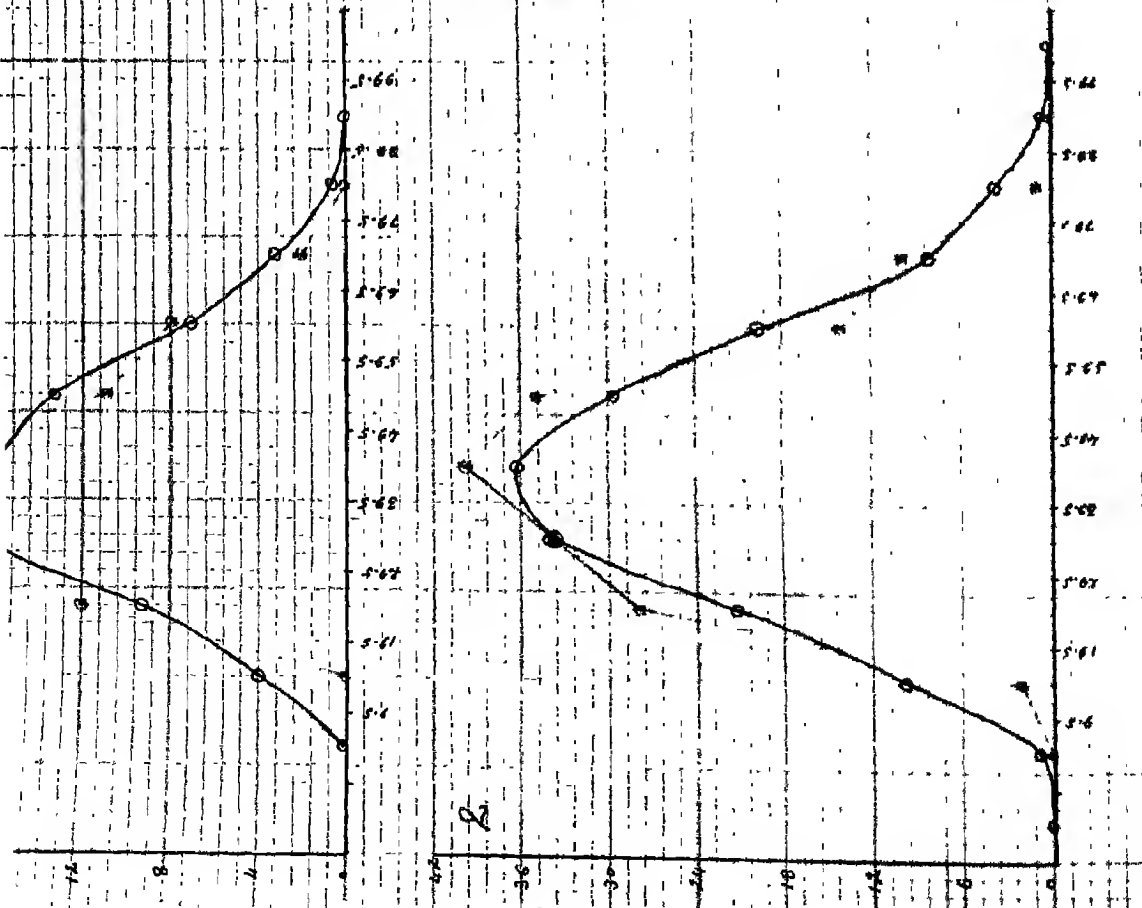

Kurtosis is not significant.

$\sum f | d | =$
1932.64

Measures of Central Tendency, Variability and Divergence
from Normality:

Mean	=	<u>44.56</u>
Median	=	<u>44.00</u>
Mode	=	<u>42.88</u>
Quartile Deviation	=	<u>11.09</u>
Mean Deviation	=	<u>11.72</u>
Standard Deviation	=	<u>14.80</u>
Skewness in Terms of Percentiles	=	<u>1.07</u>
Kurtosis	=	<u>0.27</u>

Reliability of Mean, Median, standard Deviation,

Skewness and Kurtosis:

Reliability of Mean:-

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{14.8}{\sqrt{164}} = 1.16$$

the T.M. lies between $44.56 \pm 1.96 \times 1.16$ or 42.29 & 46.83
at 0.05 level

and do $44.56 \pm 2.58 \times 1.16$ or 41.58 & 47.54
at 0.01 level

Reliability of Median:-

$$\sigma_{Min} = \frac{1.253 \sigma}{\sqrt{N}} = \frac{1.253 \times 14.8}{\sqrt{164}} = 1.448$$

T.Min lies between $44.00 \pm 1.96 \times 1.448$ or 41.16 & 46.84
at 0.05 level

and do $44.00 \pm 2.58 \times 1.448$ or 40.26 & 47.74
at 0.01 level

Reliability of SD:

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 14.8}{\sqrt{164}} = 0.8208$$

T.SD lies between $14.8 \pm 1.96 \times 0.8208$ or 13.19 & 16.41
at 0.05 level

and do $14.8 \pm 2.58 \times 0.8208$ or 12.68 & 16.92
at 0.01 level

Reliability of Skewness:-

$$\sigma_{SK} = \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}}$$

$$= \frac{0.5185 \times 41.14}{\sqrt{\frac{1.61}{164}}} = 1.665$$

$$C.R = \frac{1.07}{1.665} = 0.6425$$

0.6425 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level

Hence the Skewness is insignificant and the distribution does not show any real divergence from the normal.

Reliability of Kurtosis:

$$\sigma_{Ku} = \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{164}} = 0.0218$$

$$C.R = \frac{(0.27 - 0.263)}{0.0218} = \frac{0.007}{0.0218} = 0.3210 \text{ } 0.3201$$

0.3201 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level. Hence there is no real divergence from the normal.

$\sum fx^2 = 787$

$\sum f f d 1 = 3807.40$

Measures of Central Tendency, Variability and Divergence
from Normality.

Mean	=	<u>42.45</u>
Median	=	<u>41.6</u>
Mode	=	<u>39.9</u>
Quartile Deviation	=	<u>11.45</u>
Mean Deviation	=	<u>13.22</u>
Standard Deviation	=	<u>16.40</u>
Skewness in Terms of Percentiles	=	<u>2.03</u>
Kurtosis	=	<u>0.26</u>

Reliability of Mean, Median, Standard Deviation, Skewness & Kurtosis.

Reliability of Mean

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{16.40}{\sqrt{288}} = 0.9934$$

the T.M. lies between $42.45 \pm 1.96 \times 0.9934$ or 40.56 & 44.34
at 0.05 level

and do $42.45 \pm 2.58 \times 0.9934$ or 39.96 & 44.94
at 0.01 level

Reliability of Median:-

$$\sigma_{Mdn} = \frac{1.253\sigma}{\sqrt{N}} = \frac{1.253 \times 16.4}{\sqrt{288}} = 1.211$$

T.Mdn lies between $41.6 \pm 1.96 \times 1.211$ or 39.23 & 43.97
at 0.05 level

and do $41.6 \pm 2.58 \times 1.211$ or 38.48 & 44.72
at 0.01 level

Reliability of SD:

$$\sigma_{\sigma} = \frac{0.71\sigma}{\sqrt{N}} = \frac{0.71 \times 16.4}{\sqrt{288}} = 0.6861$$

T.SD lies between $16.4 \pm 1.96 \times 0.6861$ or 15.05 & 17.75
at 0.05 level

and do $16.4 \pm 2.58 \times 0.6861$ or 15.15 & 17.65
at 0.01 level

Reliability of Skewness:-

$$\begin{aligned} \sigma_{SK} &= \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 44.05}{\sqrt{288}} = 1.346 \end{aligned}$$

$$G.R = \frac{2.03}{1.346} = 1.509$$

1.509 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level.

Hence there is no significant divergence from the normal.

Reliability of Kurtosis:

$$\begin{aligned} \sigma_{Kk} &= \frac{0.28}{\sqrt{N}} = \frac{0.28}{\sqrt{288}} = 0.0165 \\ J.R &= \frac{(0.260 - 0.263)}{0.0165} = \frac{-0.003}{0.0165} = -0.1818 \end{aligned}$$

0.1818 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level.

Hence the leptokurtosis indicated by - .003 has no divergence significance and there is no real divergence from the normal.

Measures of Central Tendency, Variability and Divergence
from Normality.

Mean	=	43.5
Median	=	42.83
Mode	=	41.49
Quartile Deviation	=	10.92
Mean Deviation	=	10.62
Standard Deviation	=	13.00
Skewness in Terms of Percentile	=	1.46
Kurtosis	=	0.29

Reliability of Mean, Median, Standard Deviation, Skewness and Kurtosis.

Reliability of Mean:-

$$\sigma_M = \frac{\sigma}{\sqrt{N}} = \frac{13}{\sqrt{70}} = 1.553$$

T.M. lies between $43.5 \pm 1.96 \times 1.553$ or 40.45 ± 46.55
at 0.05 level
and do $43.5 \pm 2.58 \times 1.553$ or 39.49 ± 47.51
at 0.01 level

Reliability of Median:-

$$\sigma_{Mdn} = \frac{1.253\sigma}{\sqrt{N}} = \frac{1.253 \times 13}{\sqrt{70}} = 1.946$$

T.Mdn lies between $42.83 \pm 1.96 \times 1.946$ or 39.01 ± 46.65
at 0.05 level
and do $42.83 \pm 2.58 \times 1.946$ or 37.81 ± 47.85
at 0.01 level.

Reliability of SD:-

$$\sigma_{\sigma} = \frac{0.71 \sigma}{\sqrt{N}} = \frac{0.71 \times 13}{\sqrt{70}} = 1.104$$

T.SD lies between $13.0 \pm 1.96 \times 1.104$ or 10.84 & 15.16
at 0.05 level

and do $13.0 \pm 2.58 \times 1.104$ or 10.15 & 15.85
at 0.01 level

Reliability of Skewness:-

$$\begin{aligned} \sigma_{3K} &= \frac{0.5185 D}{\sqrt{N}} = \frac{0.5185 (P_{90} - P_{10})}{\sqrt{N}} \\ &= \frac{0.5185 \times 37.92}{\sqrt{70}} = 2.353 \end{aligned}$$

$$C.R = \frac{1.46}{2.353} = 0.6205$$

0.6205 is less than 1.96 at 0.05 level

and do 2.58 at 0.01 level

Hence the Skewness of 1.46 is insignificant.

Reliability of Kurtosis:-

$$\sigma_{Ku} = \frac{0.28}{\sqrt{70}} = 0.03347$$

$$C.R = \frac{(0.29 - .263)}{0.03347} = 0.8069$$

0.8069 is far below 1.96 at 0.05 level

and do 2.58 at 0.01 level

Hence there is no real divergence from the normal.

Validity.

In any satisfactory measuring instrument, two important qualities are indispensable. These are.--

1. Validity
2. Reliability.

Validity.--

The validity of a test depends upon the extent to which a test measures what it purports to measure. In a word validity means truthfulness. Validity is the most important characteristic of a good test. If a test lacks validity it is useless. "A test of low validity is a test that claims to test one thing but really tests another. A situation which makes it about as useless as the judgement of a doctor¹ who mistakes malaria for diabetes"¹. Validity is always specific in relation to some definite situation. It is not a general criterion of an examination. A test may be highly valid in one situation and invalid for use in another.

In examining the validity of an Achievement test, a distinction should be made between curricular validity and statistical validity. Curricular validity, implies the extent to which the content of the test is truly representative of the content of the course. It implied proper sampling of the essential materials employed in instruction.

1. Mensel, F.W. "Suggestions for the use of New Type Tests in India", 1939, page 41.

This has been discussed while dealing with Test construction.

Statistical Validity.-

"This refers to the mathematical processes for determining the degree to which the test agrees or correlates with some criterion which is set up as an acceptable measure of the thing in question".¹ The statistical procedures aim at validating the test as a whole and the items individually. The validation of the individual test items is taken up during item analysis and selection depending upon the difficulty value and discriminating index of each item. The question remaining over is the validation of the test as a whole.

Statistical validity takes into account the relation between the test scores and such external criteria as class marks rating by subject teacher and pupils marks in some other test constructed for the same type of use. The criterion must be an objective measure in terms of which the test is estimated. In our country we do not have suitable standardized tests ^{of} intelligence or achievement. The only available data are the class marks (tests and examinations) of the pupils in a given subject. They have to be correlated with the test marks. In this investigation the class marks of the pupils in General Science were correlated

1. Ross & Stanely: "Measurements in To-days' Schools", page 112.

with their test marks. (The number of pupils selected for this validation was 404 got by selecting every 5th pupil from the total sample of 2023) in a scattergram vide Table *page 144* and 'r' the coefficient of correlation was worked out by using the formula.-

$$r = \frac{\sum \frac{x' y'}{N} - \sigma_x \sigma_y}{\sigma_x \times \sigma_y}$$

The value of 'r' was found out to be 0.587. The reliability of the obtained validity was tested against the Null hypothesis by finding the critical ratio which is 14.43. This is far higher than 2.58 the necessary critical ratio required for the correlation to be significant at 0.01 level. "Validity coefficient for composite - scores based upon combination of several different kinds of tests are likely to be distinctly higher than 0.6 ranging up to 0.8 in rare instances but hardly ever above the latter".¹ "r from $\pm .4$ to ± 0.70 denotes marked relationship".² Therefore it may be concluded that there is a ^{marked} positive relationship between the marks obtained in the test and the class marks in general science. Hence the test measures achievement in General Science. Therefore the test is valid.

$$f_x = 4 \quad 404 \quad \sum f_y y' = 137 \quad \sum f_y y'^2 = 1361 \quad \sum x' y' = 621$$

$$x' = -3$$

$$f_x x' = -12$$

$$f$$

Calculation of "r" :-

$$r = \frac{(\sum x' y' / N - \bar{x} \bar{y})}{\sigma_x \sigma_y}$$

$$r = \frac{(1.54 - 0.0562)}{(1.54 \times 1.64)}$$

$$\sum x' y' / N = 621 / 404 = 1.54$$

$$\bar{x} = \sum x' / N = 67 / 404 = 0.166$$

$$(\bar{x})^2 = 0.0275$$

$$\bar{y} = \sum f_y y' / N = 137 / 404 = 0.339$$

$$(\bar{y})^2 = 0.1149$$

$$\sigma_x = \sqrt{\left\{ \sum x'^2 / N - (\bar{x})^2 \right\}}$$

$$= \sqrt{(2.42 - 0.0275)}$$

$$= \sqrt{2.3925}$$

$$= 1.54$$

$$\sigma_y = \sqrt{\left\{ \sum f_y y'^2 / N - (\bar{y})^2 \right\}}$$

Inter Correlation Coefficients of Six Sub-Tests in

						0.022
6 Analogies						

As the class marks obtained by the pupils are prone to the subjective some other methods were also employed to estimate the validity of the test. The validity of the test was estimated in an indirect way. The marks received by the selected 404 pupils in the different test were correlated and the coefficient of correlation between 15 combination were calculated by the product moment method. Except in the case of true false and classification and multiple choice and matching in all other cases it is about 0.50. To find out the reliability of 'r' for these combinations the P.E. for each was calculated vide table^{on page 145}. The values of 'r' for every combination are far higher than - four times the probable error. Hence 'r' is reliable.

The validity of the test was also calculated with reference to the subject teachers estimate. As the subject teachers are not able to classify pupils satisfactorily on the five points scale, the teachers of General Science were requested to name ten best and ten worst students in General Science, among those who took this test. Thus two distinct groups of students the best and the worst were got as per the teachers estimate. The scores of fifty pupils of each of these two distinct groups in this test were tabulated and their means and standard deviation calculated. The mean of the best group is 69 and that of the worst is 38.5.

Frequency Distribution to calculate the Biserial 'r'

$$N=100 \quad \sum fx = -103 \quad \sum fx^2 = 1506$$

$M = 53.95$, $SD = 18.75$.

$$r_{bis} = \frac{M_p - M_t}{\sigma} \times \frac{P}{Z}$$

$$= \frac{69.1 - 53.95}{18.75} \times \frac{.50}{.399} = .9875$$

$$\sigma_{r_{bis}} = \left(\sqrt{\frac{Pq}{Z^2}} - r_{bis}^2 \right)$$

$$\frac{1}{\sqrt{N}} = 0.0253$$

where M_t is the mean of the total group (100) M_p is the mean of the best group, P is the proportion of the best group, Z = height of ordinate separating the two groups.

The reliability of this difference was found out by calculating the critical ratio. The critical ratio is 14.00. This value of C.R. is many times higher than 1.96 and 2.58 at both the level of significance. Hence the difference between the two groups is highly significant. The test scores have correlated very well with the subject teachers estimate of the pupils. Hence this test ^{does} measure achievement in General Science. Therefore it is valid.

The biserial coefficient of correlation was also calculated for these two distinct groups. It is as high as 0.9875 with a S.E. of 0.1953. This shows that the test ^{does} measure achievement in General Science. Therefore the test is valid.

Reliability.

The other important quality of a measuring instrument is reliability when validity deals with measuring - what it proposes to measure, reliability deals with measuring it consistently. "Reliability means consistency. By itself consistency or reliability is a doubtful virtue for a test or a person might be consistently wrong, but its absence is a sign of weakness. Although high reliability is no guarantee that the test is good, low reliability does indicate that it is poor".¹ When a test is reliable, scores made by a member of a group - upon re-test with the same test or with alternate forms of the - same test may differ very little or not at all from the original. It implies precision or accuracy. However it is influenced by such factors as (a) limited sampling of items, (b) subjective scoring, (c) distraction, (d) changes in physical and psychological conditions, (e) motivation (f) and/guessing

In the present investigation many of the above factors were controlled satisfactorily. Though controlling of these factors seem to assure reliability it is not certain till the test results are verified. There are different methods of estimating the reliability of a test.

(1) The Test re-test Method:-

This is the simplest method of determining reliability

1. Ross & Stanely: "Measurement in To-days' Schools", pages 22.

the test is given and repeated on the same group at a later date and the extent of agreement by computing the coefficient of correlation between two series of scores is found out.. This method has many limitations such as the same conditions to be maintained for repeated administration of the test, the influence of time factor etc.. This is not a common method. Moreover the method could not be used in this investigation as the test could not be re-tested.

2. The other method is the Alternative or Parallel Forms Method.

Two parallel forms of the same test are constructed and administered to the same pupils after a sufficient interval of time to weaken memory and practice effects. The coefficient of correlation is calculated between the two sets of scores and the agreement between the two forms of the test is found out. This method was also not resorted to.

Split Half Method :-

3. There is yet another method of estimating Reliability. This is termed the split -half method. In this method the test is broken into two equal halves composed of odd numbered items and even numbered items. The correlation between the scores of the two halves of the test is regarded as an estimate of half test reliability. The reliability of the entire test is found out by using the Spearman - Brown prophecy formula.-

Odd's Scores

Scattergram

	0 - 9	10 - 19	20 - 29	30 - 39	40 - 49	f_o	x	$f_o x$	$f_o x^2$	xy
1	2	3	4	5	6	7	8	9	10	11

10-19 12 10 (24) 22 2 44 88 64

30-39 36 100 (100) 146 1 146 146 122

20-29 20 115 23 158 0 0 0 0

10-19 3 48 23 74 -1 -74 74 54

0-9 2 (8) 2 (4) 4 -2 -8 16 12

f_o 5 70 173 136 21 $N = 404$ $\sum f_o x = + 108$ $\sum f_o x^2 = 284$ $\sum xy = 282$

y -2 -1 0 1 2
 $f_o y$ -10 -70 0 135 42
 $\sum f_o y = + 97$

$f_o y^2$ 20 70 0 135 44
 $\sum f_o y^2 = 269$

xy 14 62 0 124 62
 $\sum xy = 252$

$$r = \frac{\frac{\sum x' y'}{N} - c_x c_y}{\sigma_x \sigma_y} \quad \frac{\sum x' y'}{N} = \frac{252}{404} = 0.621$$

$$c_x = \frac{\sum f_x}{N} = \frac{108}{404} = 0.26$$

$$c_y = \frac{\sum f_y}{N} = \frac{97}{404} = 0.24$$

$$\sigma_x = 1 \sqrt{\frac{\sum f_x^2}{N} - c^2} \quad c_x \times c_y = .26 \times .24 = 0.0624$$

$$= 1 \sqrt{\frac{324}{404} - (.26)^2} = 1 \sqrt{0.802 - 0.0676}$$

$$= 1 \sqrt{0.7344} = 1 \times 0.86$$

$$\sigma_y = 1 \sqrt{\frac{\sum f_y^2}{N} - c^2} = 1 \sqrt{\frac{269}{404} - c^2}$$

$$= 1 \sqrt{.6658 - 0.0576} = 1 \sqrt{0.6082} = 1 \times 0.78$$

$$r = \frac{0.624 - 0.0624}{.86 \times .78} = \frac{0.5616}{0.6708} = \underline{0.84}$$

$$r_{11} = \frac{2 r_{12}}{1 + r_{12}} = \frac{2 \times .84}{1 + .84} = \frac{1.68}{1.84} = \underline{0.91}$$

Spearman Brown formula

The index of reliability:-

$$r_{\infty} = \sqrt{r_{11}} = \sqrt{0.91} = \underline{0.95}$$

This method lays emphasis on the inter correlation of the items in the test and the correlations of the items in the test as a whole. There are many formulas for determining test reliability of which the most useful is -

$$r_{11} = \frac{n}{(n-1)} \times \frac{\sigma_t^2 - \sum pq}{\sigma_t^2} \quad \text{in which?}$$

r_{11} = reliability coefficient of the whole test.

n = number of items in the test

t = the S.D. of the test scores.

p = proportion of the group answering an it correctly

$q = (1 - p)$ proportion of the group answering on it incorrectly.

In this investigation the estimations of reliability is made by the split half method, as the first two methods were not feasible. 404 random cases were selected out of the total number of 2023 cases. Every fifth cases was drawn from the orderly arranged entire sample. The test was divided into halves, the odd numbered items making one half and the even number items, the other. A scattergram was drawn (vide table) for computing the correlation coefficient and it was determined by the product moment formula. The reliability coefficient of the whole test is 0.91.

Index of Reliability.

"It measures the trust worthiness of test scores

c.f.	f	x	fx	fx ²
------	---	---	----	-----------------

90-99	0	4	0	0
80-89	5	3	15	45

404	fx =	fx ² =
	-274	1252

$$\sigma = \sqrt{\frac{fx^2}{N} - \frac{(\sum fx)^2}{N^2}}$$

$$\frac{\sum fx^2}{N} = \frac{1252}{404} = 3.098$$

$$r_{11} = \frac{N}{N-1}$$

$$\frac{\sigma^2 - \frac{1}{N}}{\sigma^2}$$

$$= \frac{120}{119} \times \frac{263.56 - 11.19}{263.56}$$

$$cx = \frac{-274}{404} = -0.68$$

$$\sigma^2 = 0.4624$$

$$= \frac{120}{119} \times \frac{238.76}{263.56}$$

$$\sigma = \sqrt{3.98 - 0.4624} \times 10$$

$$= 0.91$$

$$= 10 \sqrt{2.6356}$$

$$= 100 \times 2.6356$$

$$= 263.56$$

formula.--

$$r_{11} = \frac{2 r_{\frac{1}{2}} \frac{1}{11}}{1 + r_{\frac{1}{2}} \frac{1}{11}}$$

where r_{11} = the reliability coefficient of the whole test.

$r_{\frac{1}{2}} \frac{1}{11}$ = the reliability of coefficient of one half of the test found experimentally.

The split half is regarded as the best of the methods for determining test reliability. This can be used when it is not feasible to construct a parallel form of the test or to repeat the test. It excludes the creeping in of variations in two testing conditions.

The split half method is criticised on the ground that the test can be divided into two halves in a variety of ways so that the reliability coefficient is not a unique value. "When items are placed in order of difficulty the split into odds and evens gives a unique determination of the reliability coefficient".¹

J.F. Kuder and R.W. Richardson have developed a formula for determining the reliability of a test without calculating the coefficient of correlation and free from the objections raised against the other methods. This method is called "The Method of Rational Equivalence".

1. Garret H.E. "Statistics in Psychology and Education", page 334.

by showing how well obtained scores agree with their theoretical true counterparts. It gives the "maximum correlation which the given test is capable of yielding"¹ The index of reliability in this case is 0.95

"A test whose index of reliability is only 0.50 is an extremely poor estimate of the function which it is trying to measure"²

Since the index of reliability in the present test is 0.95 it might be said that the test measures Achievement in general science satisfactorily well.

Reliability was calculated by the Rational equivalence method also. vide table on page 154 and the Reliability coefficient was determined to be 0.91. Since the reliability of the test by both the methods is 0.91 and the index of reliability is as high as 0.95, Therefore the test can be taken as highly reliable.

1. Garret. "Statistics in psychology and Education", page 342.

2. Ibid.

1000

Test Norms.

A norm is an estimate of some characteristic of the distribution of scores for a specific population. "One of the major uses claimed for educational achievement tests is 'evaluation' of the content and organization of the curriculum and of the quality of effectiveness in instruction in individual schools. This implies an evaluation of group, rather than of individual pupil performance. What is needed for this purpose obviously, is a type of norms that is descriptive of distribution of measures of group achievement, that is of school averages, rather than of distributions of individual pupil scores".¹ There are several kinds of norms, such as age norms, grade norms and percentile norms.

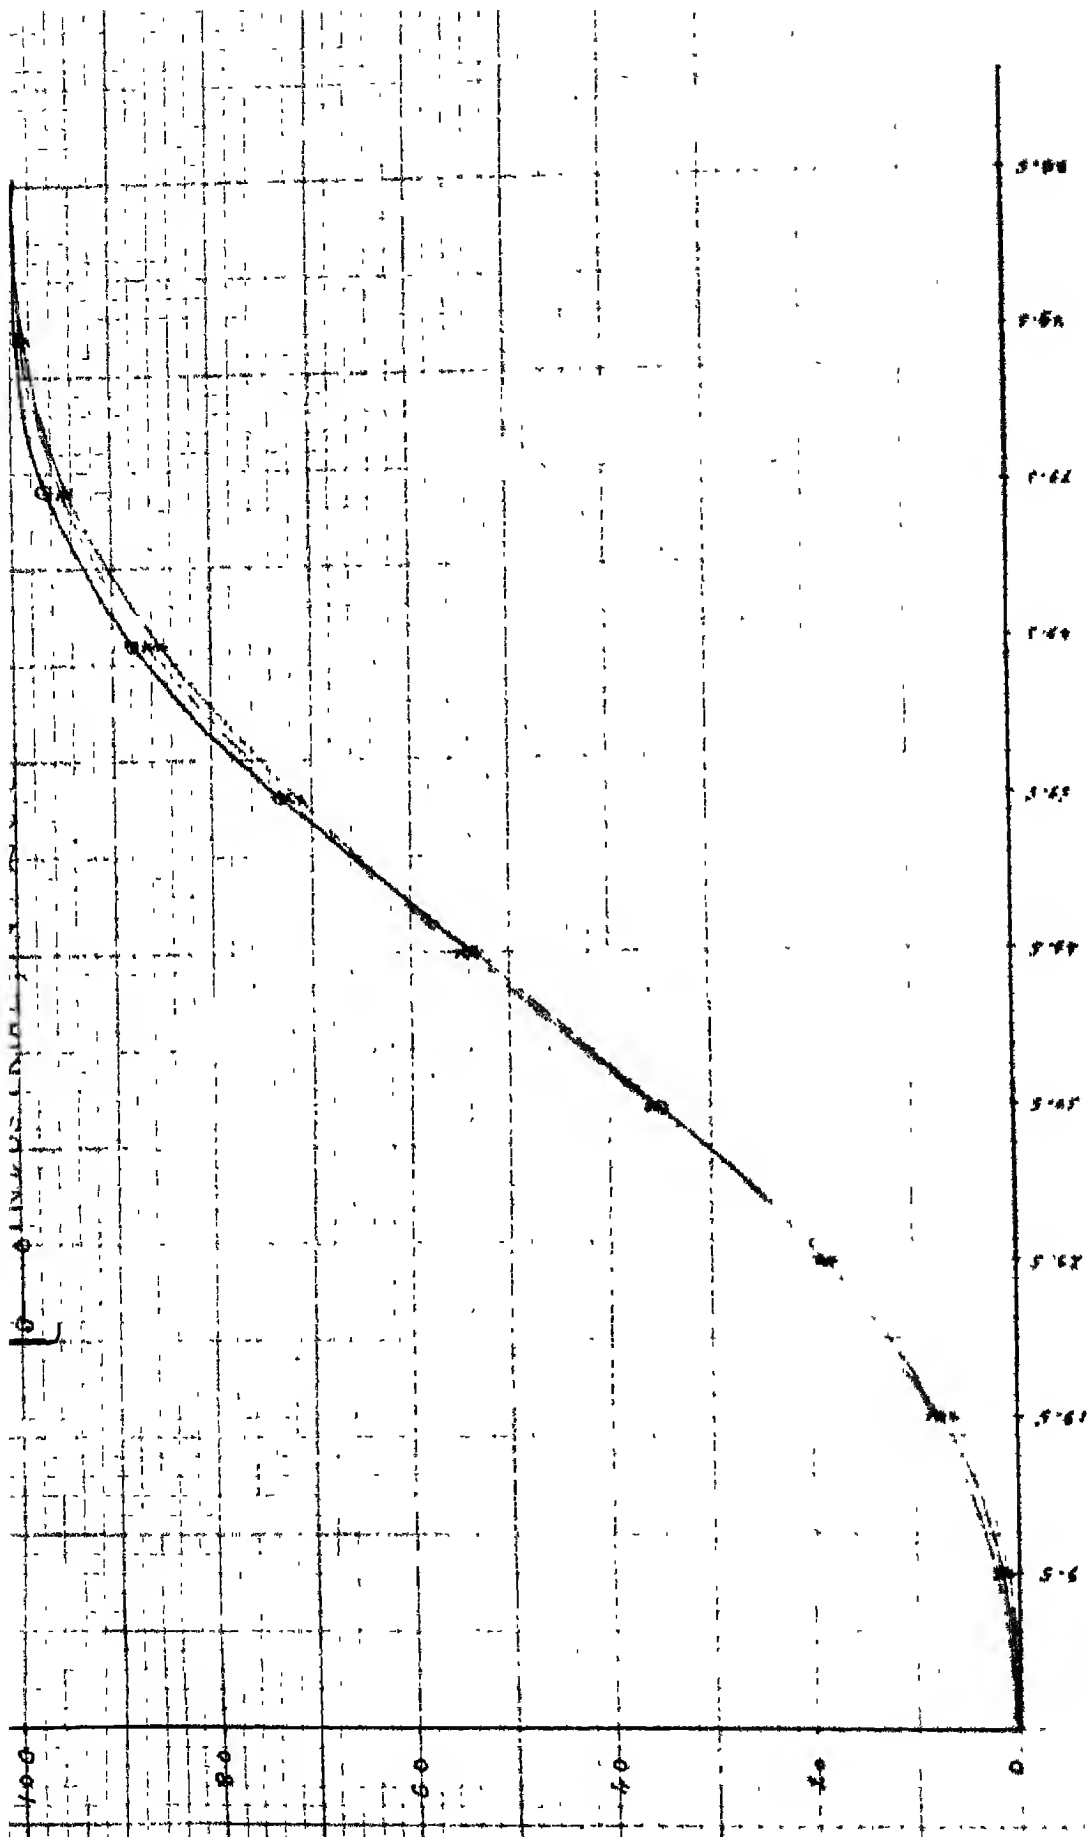

Grade Norms state the mean score obtained by each of the several groups classified according to school grade.

Percentile norms state the percentile to which a given score corresponds in some specified reference group.

Grade norms and percentile norms have been calculated in this investigation. The mean calculated for the entire sample is 47.28. This can be taken as the norm of the specified group in this Achievement Test. The norms of the various groups have been calculated and given in table on pages 139 and 140. (page 164)

Percentile norms have also been calculated. They are estimated graphically also by the help of the ogive drawn for the entire sample.

1. Lindquist:

Comparison of Groups.

In order to find out the level of achievement of the various sub-groups in this sample the reliability of their average performance has to be found out and the significance of the difference if any has to be established. In this investigation the average performances of the following groups have been compared and the significance of the difference if any, has been calculated. This has been represented graphically also.

Urban, Rural, Industrial, Boys, Girls and English & Kan. Medium.

Statement showing the Mean and S.D of the Different Groups.

Group.	Mean	S.D.
Urban	47.17	16.91
Rural	47.17	17.49
Industrial	48.03	17.55
Boys	48.68	17.71
Girls	43.25	15.56
Rural Boys	47.76	17.86
Urban Boys	49.50	17.86
Industrial Boys	49.65	18.62
Rural Girls	44.56	14.80
Urban Girls	42.25	16.40
Industrial Girls	43.50	13.00

Reliability of Difference between Means:

1) Rural and Urban:-

$$\text{Mean for Rural} = 47.17$$

$$\text{Mean for Urban} = 47.17$$

$$\text{Difference} = \underline{0}$$

ii) Urban and Industrial:-

$$M_1 = \text{Mean for Urban} = 47.17$$

$$M_2 = \text{Mean for Industrial} = \underline{48.03}$$

$$\text{Difference} = \underline{0.86}$$

$$\sigma_D \text{ or } \sigma_{M_1 - M_2} = \sqrt{\sigma_{M_1}^2 + \sigma_{M_2}^2}$$

Where σ_{M_1} is the S.E. of first Mean and σ_{M_2} is the S.E. of the second Mean.

$$M_1 = 0.594; \quad M_2 = 1.076$$

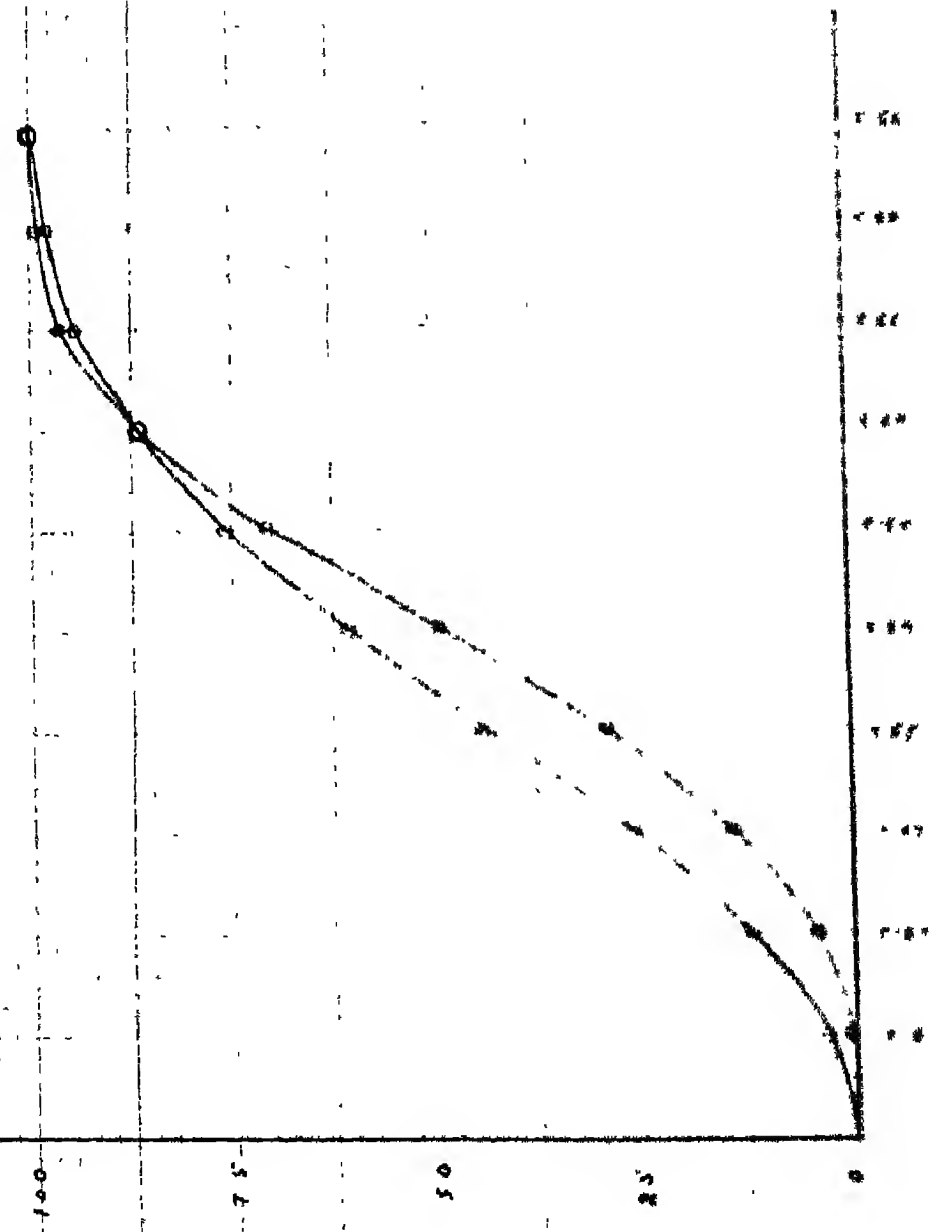

$$\begin{aligned} \text{Therefore } \sigma_D &= \sqrt{(.594)^2 + (1.076)^2} \\ &= \sqrt{1.5109} = 1.229 \end{aligned}$$

$$\text{Therefore C.R.} = \frac{D}{\sigma_D} = \frac{0.86}{1.229} = 0.93$$

This is much below 1.96 and 2.58 at the .05 and .01 levels of confidence. Hence the difference of 0.86 between the two means is not significant.

ENGLISH MEDIUM; N-845

KANNADA MEDIUM; N-1178

iii) Industrial and Rural.-

	<u>Industrial</u>	<u>Rural</u>
Mean	48.03	47.17
Difference	48.03 - 47.17 = 0.86	
σ_{N_1}	= 1.0760	
σ_{N_2}	= 0.5665	

$$\text{Therefore } \sigma_D = \sqrt{\frac{\sigma^2}{N_1} + \frac{\sigma^2}{N_2}} = \sqrt{(1.076)^2 + (.5665)^2}$$

$$= \sqrt{4.367} = 2.089$$

$$\text{Therefore i.h. } \frac{D}{\sigma_D} = \frac{0.86}{2.089} = 0.41$$

Hence the difference of 0.86 between the two means is of no significance.

iv) Kannada Medium and English Medium.-

	<u>Kannada.</u>	<u>English</u>
Mean	49.47	44.23
Difference	5.24	

$$\sigma_{N_K} = 0.4516 \quad \sigma_{N_E} = 0.6604$$

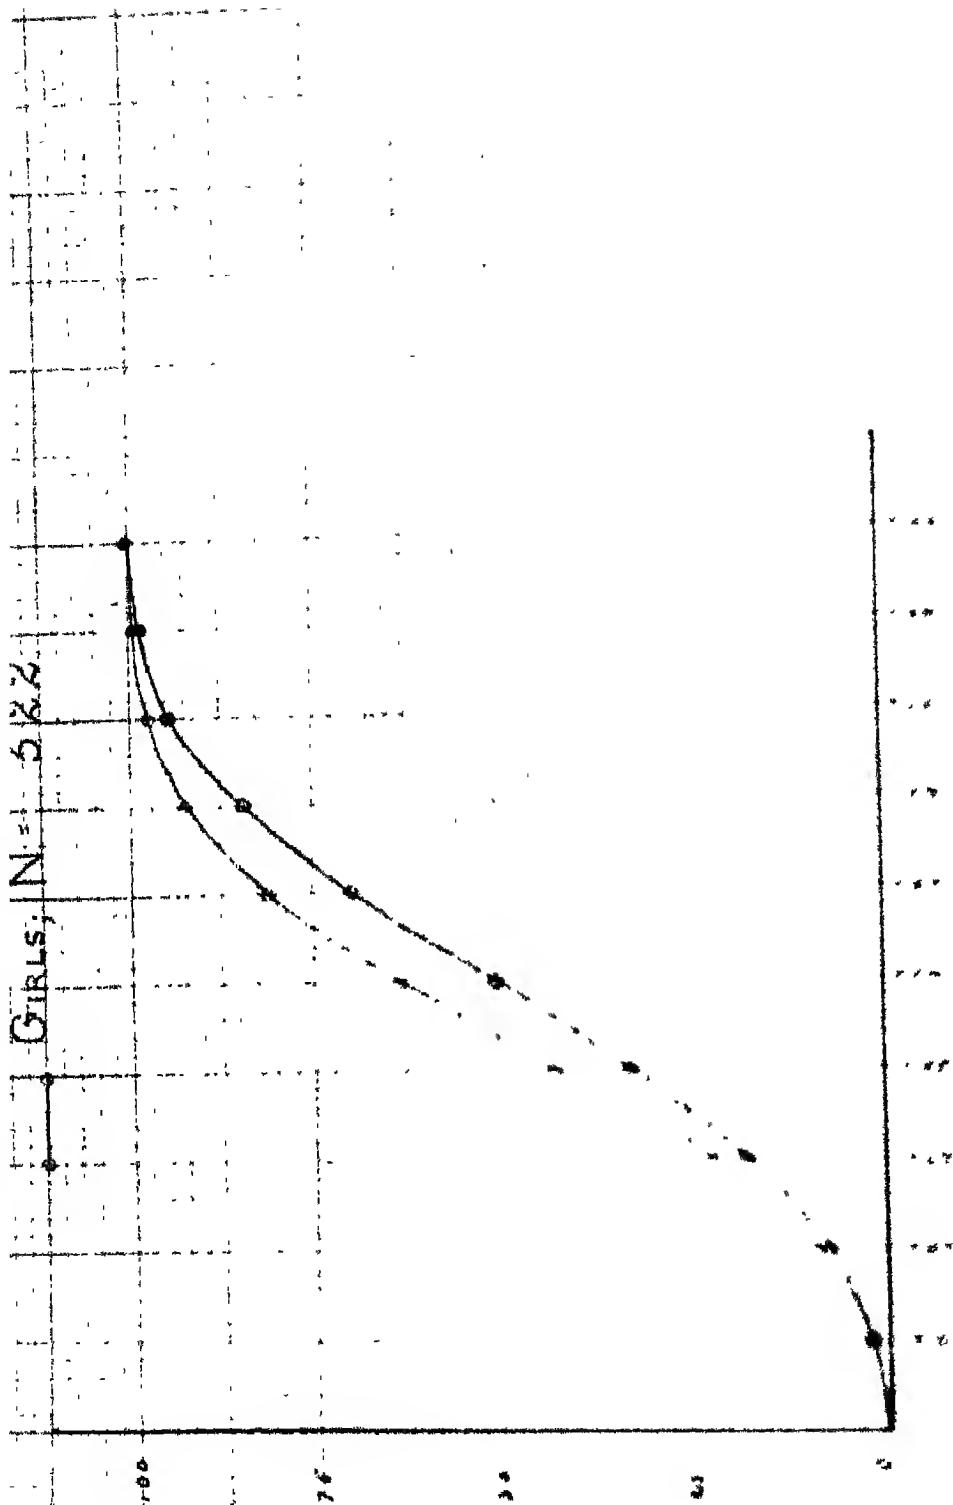

$$\text{Therefore } \sigma_D = \sqrt{(0.4516)^2 + (0.6604)^2} = \sqrt{0.6401}$$

$$= 0.8002$$

$$\text{Therefore i.h. } = \frac{5.24}{0.8002} = 6.55$$

Hence the difference of 5.24 between the two means is significant at both the .05 and .01 levels of significance.

Explanation: =

Explanation:-

This shows that the performance of the Kannada medium candidates is decidedly better than that of the English medium candidate. This may be due to the language difficulty which the English medium candidates encounter. The question of understanding the subject depends upon understanding the language in which it is taught. A sudden change over from the medium of instruction in Kannada, Tamil or Urdu to English confounds the pupils.

v) Boys and Girls:-

	<u>Boys</u>	<u>Girls.</u>
Mean	48.68	43.25
Difference	<u>5.43</u>	

$$\sigma_{M_1} = 0.4571; \quad \sigma_{M_2} = 0.6870$$

$$\text{Therefore } \sigma_D = \sqrt{(0.4571)^2 + (0.6870)^2} = \sqrt{0.6810}$$

$$= 0.8252$$

$$\text{Therefore J.R.} = \frac{5.43}{0.8252} = 6.58 \text{ is greater than}$$

1.96 and 2.58 at both levels of significance.

Therefore the difference is significant.

Explanation:-

Girls are shy by nature and suffer from inferiority complex. Even if they do not understand any thing they do not demand a clarification just to conceive conceal their ignorance. Therefore more often than not they rely upon textual information and memory. In addition to these a part of their time is used up in attending to domestic affairs.

C H A P T E R - VI

Summary of Conclusions and Suggestions for Further Work.

The level of attainment in school subjects is satisfactorily assessed by Standardized Achievement Tests. In our country such tests are not available. Very few - attempts have been made so far in this direction. The present study is a humble attempt to satisfy this need to a - little extent in the subject of General Science.

A. Summary of Conclusions.

1. In this standardized test of achievement the distribution of the scores of the entire group as well as the subgroups almost fit in the normal probability curve. This proves that the technique adopted in this measurement is - correct and objective.

2. The efficiency of the test is determined in terms of its reliability and validity.

a) The Reliability of the Test:-

1) By split-half method	..	0.91
2) By Rational Equivalence Method.		0.91
Index of Reliability	..	0.95

Hence the test is highly reliable.

b) The validity of the test.-

1) Comparing test marks with class marks	0.58%
--	----	----	-------

- 2) Finding the significance of difference between 50 best and 50 worst students as per the teachers' rating estimate.

a) Difference between their means	..	30.50
b) Critical Ratio	..	14.00

The difference is highly significant.

- 3) The biserial coefficient of correlation between the best and worst students as estimated by the subject teachers.
- | | | |
|--------------------|----|--------|
| S.E. of $r_{bis.}$ | .. | 0.1953 |
|--------------------|----|--------|

Hence the test is valid.

- 3 Norms:- These have been established in two forms:

(1) Mean Norms, (2) Percentile Norms.

1) Mean Norms.

<u>Group.</u>	<u>Mean</u>	<u>S.D.</u>
a) Entire sample	47.28	17.34
b) Rural Group	47.17	16.91
c) Urban Group	47.17	17.49
d) Industrial Group	48.03	17.55
e) Kannada Medium	49.47	15.50
f) English Medium	44.23	19.20
g) Boys	49.31	17.71
h) Girls	43.25	15.56

2) Percentile Norms.

a)	p ₅	..	19.63
b)	p ₁₀	..	23.64
c)	p ₂₀	..	31.10
d)	p ₂₅	..	34.10
e)	p ₃₀	..	36.09
f)	p ₄₀	..	42.40
g)	p ₅₀	..	47.23
h)	p ₆₀	..	52.30
i)	p ₇₀	..	57.50
j)	p ₇₅	..	60.30
k)	p ₈₀	..	63.50
l)	p ₉₀	..	70.40
m)	p ₉₅	..	76.30

4

Comparison of Groups.

- (1) Rural and Urban: There is no difference between the performance of the Rural and Urban students.
- (2) Industrial and Urban. There is a slight difference of 0.86 between the performance of the Industrial and Urban students. But it is not significant.
- (3) Industrial and Rural. There is a slight difference of 0.86 between the performance of the Industrial and Rural students. But it is not significant.

(4) Kannada Medium and English Medium.

There is a significant difference of 5.24 between the performance of Kannada Medium and English Medium students. The performance of Kannada Medium pupils is superior to that of English Medium ones.

(5) Boys and Girls.

There is a difference of 5.80 between the performance of boys and girls. The difference is highly significant. The performance of the boys is superior to that of the girls.

B. Suggestions for Further Work.

1. The present test is constructed and standardized for High School I Year class (ex-Mysore area) based upon the syllabus of 1956. This syllabus has since been revised. As a consequence the test has to be modified to suit the new syllabus and then standardized on a larger scale drawing a more representative sample from the several parts of new - Mysore State. Considering the magnitude of the work, this has to be taken up by the Bureau of Research of the Department of Public Instruction, Mysore.

2. This is the first standardized test in General Science. It is desirable to have parallel forms of the test and standardized them. Hence other tests in general science for the same standard may be devised and standardized.

3. On the same lines Achievement tests in General Science for the remaining two standards of the High school may be constructed and standardized.

4. The present investigation reveals that there is a

significant difference between the achievement of boys and that of the girls in general science. Before any definite conclusions can be drawn this has to be further verified by administering the test on an intensive scale to larger samples of boys and girls.

5. A significant difference is also found in the performance of the Kannada Medium pupils and the English Medium pupils. This again is a finding of great importance in the field of education. Hence this aspect has also to be measured on an intensive measure.

6. The present investigation has tried to find out in a general way, if there is any difference between the performance of children of Urban, Rural and Industrial areas. But it would be of interest to obtain further details about the occupation of the parents and find out the relative performance of children coming from different occupational homes.

Appendix A,

3 (a) PHYSICS

I YEAR - Two periods a week.

1) Study of the general properties of matter:-

Occupies space, transfers motion, offers resistance, has weight; divisibility, porosity, compressibility, elasticity. The three states of matter.

Special properties of solids: rigidity, tenacity, ductility, malleability, hardness.

Special properties of liquids: Definite size and no definite shape: find their level; communicate pressure equally in all directions; Water supply in rural and urban areas.

Special properties of gases: occupy all the space; have weight; exert pressure in all directions syringe, penfiller, cycle pump, inflator. Measuring the pressure of the atmosphere with a barometer.

ii) Length, units in British and Metric systems and the relations between them.

Area: Units.

Volume: units, capacity, measuring jar, pipette. Measurement of volume by displacement. (Use of graduated jar).

iii) Mass, Weight and Density: Units, measurement

of mass by the common balance; measurement of weight by the spring balance. Difference between mass and weight. Meaning of density. Determination of the density of common substances.

iv) Effect of heat on bodies: expansion. Temperature and its measurement. Construction of a thermometer. Centigrade and Fahrenheit scales. Clinical thermometer.

Transference of heat; conduction, good and bad conductors; thermos flask, convection, ventilation in buildings: radiation. Simple steam engine and - internal combustion engine.

3 (b) CHEMISTRY.

Chemical changes - (melting of ice or sulphur).

Chemical changes -

a) Chemical combination - (burning of sulphur, union between iron and sulphur).

b) Chemical decomposition . (Action of heat on red oxide of mercury) - Elements and compounds.

Separation of mixtures using common laboratory methods.-

Decantation, filtration, solution, evaporation and crystallisation as applied to mixtures of sand and common

salt; and iron filings and sulphur.

2. Air.- Air contains oxygen and nitrogen; a burning candle uses up oxygen; nitrogen does not support combustion; oxygen is necessary for breathing; metals heated in air increase in weight; iron rusts in moist air; composition of air by volume (burning of phosphorus in a bell jar).

3. Oxygen.- Discovery of oxygen; action of heat on potassium chlorate; preparation of oxygen by heating a mixture of potassium chlorate and manganese dioxide; - properties and uses of oxygen.

4. Water.- Natural sources of water; common impurities in water; water purification; distillation of water; water is a chemical compound; action of sodium on water; decomposition of water by an electric current; composition of water by volume (composition of water by weight is to be indicated).

5. Hydrogen.- Preparation of hydrogen by the action of dilute-sulphuric acid on zinc; properties of hydrogen; water is formed when hydrogen burns in air.

6. Carbon.- Preparation, properties and uses of charcoal; mention of the other forms of carbon (graphite and diamond) and their uses. When a candle burns in air, the products formed are water and carbon dioxide.

Revision of portions taught in the I Year -(6 periods)

I YEAR - Two periods a week.

The parts of a typical plant like the bean.-

Root, Stem, Bud, Leaf, Flower, Fruit and Seed.

The structure and germination of the bean seed.

The soil: demonstration of its constituents - sand, clay and humus. Water and air in the soil. Water holding capacity of soils. The work of earthworms in the formation of soil.

Storage organs in plants. Vegetative reproduction. Cuttings, bulbs, tubers, rhizomes.

The external features, habits, food and life history of (1) the butterfly or moth and (2) the frog.

The parts of the human body and a simple account of the functions of the chief organs.

The circulation of blood in man.

Appendix B

TEACHERS' COLLEGE, MYORE

ACHIEVEMENT TEST IN GENERAL SCIENCE.

(Physics, Chemistry and
Biology)

(For High School I Year Students)

TRY-OUT

Name
Age Boy/Girl. Class
Optional Subject Mother Tongue
Native Place: City Town Village
School
Education of Parents, Father Mother
Income of Parents Date

INSTRUCTIONS

- 1 Fill in the above entries first.
- 2 Read the instructions given at the beginning of each test carefully, understand and then begin to answer.
- 3 Answer these questions as quickly as you can
- 4 Do not answer the questions you do not know and those about which you are doubtful.
- 5 If you cannot answer any question do not waste time. Pass on to the question next to it. You may come back to them and answer at the end if there is time.
- 6 Do not ask questions after you have started answering.

TRUE-FALSE TEST

INSTRUCTIONS:

Some of the following statements are true and some are false. The letters T & F are printed on the left hand side of each statement. Encircle the letter 'T' if the statement is true. Encircle the 'F' if the statement is false. Do not mark statements you do not know. Do not guess. Guessing reduces your score.

Sample examples.

(T) F 1. Honey is a viscous liquid.

T (F) 2. Charcoal is crystalline.

Statement (1) is true. Therefore a circle is put round T.

Statement(2) is false and therefore a circle is put round (F)

Answer the following Statements as above.

T. F 1 The unit of length in the British system is called meter

T F 2 The larva of the frog is called the caterpillar

T F 3 When sodium is thrown on water oxygen is given out.

T F 4 A body weight more at the poles than at the equator

T F 5 The mass of a body is measured by balancing it - against a known mass on a pair of scales.

T F 6 Density is the mass of unit volume of a substance.

T F 7 The frog buries itself in the mud when the tank dries.

T F 8 The larva of the butterfly changes its skin 3 to 4 times.

T F 9 A graduated measuring jar is used to find the volume of a small irregular insoluble body.

T F 10 Graphite is an allotropic form of carbon.

T F 11 Adhesion denotes the attraction between the unlike particles of matter.

T F 12 A clinical thermometer is one foot long.

T F 13 The pressure of the atmosphere varies from place to place

- T F 14. When potassium permanganate is heated, hydrogen is given out.
- T F 15. Liquids have a definite shape.
- T F 16. The bean seed has a single cotyledon.
- T F 17. Sodium is kept in water.
- T F 18. Calipers (Slide) are used to measure the diameter of a cylindrical rod.
- T F 19. The right auricle receives pure blood.
- T F 20. Iodine melts when it is heated.
- T F 21. Burning of paper is a physical change.
- T F 22. Hydrogen is a supporter of combustion.
- T F 23. The wings of a butterfly are covered with scales.
- T F 24. White corpuscles have an irregular shape.
- T F 25. Heat is transmitted in liquids by conduction.
- T F 26. The movements of the body are caused by muscles.
- T F 27. Liquids flow from a higher level to a lower level.
- T F 28. An element can be split up into two or more than two simpler parts.
- T F 29. The arm region has two bones.
- T F 30. Some solids are malleable.
- T F 31. The cotyledons of bean seeds remain below the soil after germination.
- T F 32. Liquids find their own level.
- T F 33. A thermos flask is used to measure the quantity of a liquid.
- T F 34. Water kept in a mud pot cools due to vaporisation.
- T F 35. A frog is called an amphibian.
- T F 36. Corolla is a non-essential part of a flower.
- T F 37. Manganese dioxide is a catalytic agent.
- T F 38. Matter is porous.
- T F 39. Bulb is a storage organ.
- T F 40. When a drop of water falls on the glass chimney of a lighted

- T F 41. A clinical thermometer is graduated from 95.F. to 110.
T F 42. Mercury is a convenient liquid for thermometers.
T F 43. The property of matter used in the construction of a
spring balance is rigidity.
T F 44. The object to be weighed should be kept in the left hand
pan of a balance.
T F 45. When the pointer of a balance swings equally on either
side of the central point then the weights in the pans
are balanced.
T F 46. The part of air that support life is Nitrogen.
T F 47. Buds are found in the space between the primary and the
secondary roots.
T F 48. One inch is equal to 3 cms.
T F 49. Hydrogen is heavier than air.
T F 50. Sand in water can be removed by sublimation.

Modified True-False Test

Instructions: Some of the following items are true and some are false.

The letters T and F are printed on the left hand side of each statement.

If the statement is true encircle the letter "T". If the statement
is false encircle the letter "F". In ~~each~~ each statement one word
is underlined. This word makes the statement true and false. If you think
a statement is false it can be made "true" by changing the underlined word.
Think such words and write them in the space provided on the left hand side
of each statement.

Sample Examples: () (T) F (1) The unit of mass in the British
system is the pound.

(Verona) T (F) (2) Sponge absorbs water freely because it is elastic.

The first statement is true and so "T" is encircled. There is no need to change

the underlined word. But the second statement is false. "F" is therefore encircled. The underlined word makes the statement false. The sponge absorbs water because it is porous. So the word elastic has to be changed to "porous."

Answer the following statements as above:-

- () T F 1 Sun's heat reached our body by the process of Convection.
- () T F 2 The mass of a body is measured by a thermometer.
- () T F 3 One or more new substances are formed in a chemical changes.
- () T F 4 The part of a leaf above the stalk is called the Lamina.
- () T F 5 Nitrogen is the inertive part of air.
- () T F 6 Heat and light are usually produced in a physical change.
- () T F 7 Joseph priestly discovered oxygen.
- () T F 8 Water is easily absorbed in a claying soil.
- () T F 9 Crops like ragi, jowar and pulses are raised in dry lands.
- () T F 10 The frog belongs to the group of vertebrates.
- () T F 11 The melting point of ice in farenheit scale is 32.
- () T F 12 The density of water at 4.C in the metric system is one pound.
- () T F 13 A rod of iron kept in fire for some time begins to burn.
- () T F 14 The highest temperature that a clinical thermometer can measure is 40.F.
- () T F 15 100 c.c. of a liquid is called a litre.
- () T F 16 The unit of weight in the metric system is one pound.

- () T F 17. Sodium carbonate is efflorescent.
- () T F 18. When iron is mixed with sulphur iron sulphide is formed.
- () T F 19. Air is a mixture.
- () T F 20. Diamond is an amorphous form of carbon.
- () T F 21. Hydrogen is a combustible gas.
- () T F 22. When sugar dissolves in water, sugar is called a solvent.
- () T F 23. When hydrogen burns in air water is formed.
- () T F 24. The colour of white corpuscles is due to the presence of haemoglobin.
- () T F 25. The upper arm of man contains two bones.
- () T F 26. A hinge joint is present between the thigh bone and the pelvic girdle.
- () T F 27. Paddy plants have a tap root system.
- () T F 28. The presence of earthworms in the soil is harmful to plants.
- () T F 29. In calab the food is stored in the stem.
- () T F 30. Two simple eyes are found in the head of the butter fly.

MULTIPLE CHOICE TEST

Instructions:- Here are some incomplete statements. They can be completed by only one of the five possible answers given select the correct answer and write its number preceding it in the space provided on the left hand side of the statement.

Example:- (b) Stigma is a part of -- (a) Gynostema (b) Pistil (c) Leaf.
(d) Stamen (fruit) (e) pistil is,
correct therefore "B" is written in the bracket.

Similarly try the following:-

- () 1. A thermometer is used to measure ----- (a) Temperature.
(b) pressure (c) Weight (d) Height (e) Volume.
- () 2. Heat is transmitted in solids by ----- (a) Convection
(b) evaporation (c) distillation (d) sublimation.
- () 3. When air is heated it ----- (a) Contracts. (b) breaks up
(c) solidifies (d) expands (e) liquifies.
- () 4. The average pulse rate of a man is ----- (a) 100 (b) 45.
(c) 72 (d) 60 (e) 50.
- () 5. The property by virtue of which solids can be
beaten into thin sheets is called ----- (a) rigidity
(b) tenacity (c) elasticity (d) malleability (e) ductility
- () 6. The normal temperature of a human being is -----
(a) 100. (b) 104.2 F. (c) 98.6 F. (d) 93.5 F (e) 90.3 F
- () 7. Combustion is another name for ----- (a) drying. (b)
contracting. (c) boiling (d) burning (e) melting.
- () 8. Substances without crystalline shape are called -----
(a). Dense (b) opaque (c) elastic (d) inert (e) amorphous.
- () 9. Distillation is a means of ----- (a) purifying water
(b) securing pressure (c) transmitting water (d) ~~pumping~~
pumping water (e) securing heat.
- () 10. The purpose of flowers in a plant is to develop -----
(a) roots. (b) seeds (c) leaves (d) perianths (e) branches.
- () 11. The butterfly has ----- of legs. (a) a pair (b) three pairs
(c) two pairs (d) four pairs (e) five pairs.
- () 12. Electrolysis of water liberates hydrogen and -----
(a) Chlorine (b) nitrogen (c) Ammonia (d) Oxygen (e) Carbon
dioxide.
- () 13. The higher fixed point in the centigrade thermometer is
----- (a) 0 (b) 32 (c) 100 (d) 120 (e) 212
- () 14. When steam is passed over red hot iron ----- is given out.
(a) Oxygen (b) Nitrogen (c) Hydrogen (d) CO_2 (e) air.

- () 15. A solid that absorbs ~~xxxxxxxxxxxxxxxxxxxxxxxx~~ ~~xxxxx~~ moisture from the atmosphere is called a ----- (a) sublime substance (b) anhydrous substance (c) deliquescent substance (d) dry (e) efflorescent.
- () 16. The ~~xxxxx~~ solution from which crystals grow is called ----- (a) dilute solution (b) distilled water (c) mother liquor (d) royal water (e) strong water.
- () 17. Insoluble impurities from a liquid are removed by ----- (a) Crystallisation (b) sublimation (c) evaporation (d) filtration (e) saturation.
- () 18. The apparatus used to measure the atmosphere pressure is called ----- (a) lactometer (b) thermometer (c) hydrometer (d) ~~xxxxxxxx~~ Potometer (e) Barometer.
- () 19. The plumula grows into ----- (a) cotyledon (b) primary axis (c) flower (d) root system (e) shoot system.
- () 20. When hydrogen is passed over heated copper oxide, copper ~~oxide~~ ~~that~~ becomes copper and hydrogen becomes ----- (a) carbon dioxide (b) hydrogen chloride (c) hydrogen peroxide (d) ammonia (e) water.
- () 21. The lower fixed point of a thermometer is ----- (a) the boiling point of water (b) the melting point of sulphur (c) the melting point of ice (d) the boiling point of milk (e) the melting point of wax.
- () 22. The yellow dust in a flower is ----- (a) Chlorophyll (b) ovules (c) protoplasm (d) pollen (e) dirt.
- () 23. The purpose of the roots of plants is to ----- (a) take in -----
- () 24. The cerebellum is given off carbon dioxide take in soil water (d) give off waste matter (e) manufacture of starch.

- () 24. The corolla is made up of ----- (a) manufacture
of starch (b) stamens (c) ovules (d) pistels
(e) petals
- () 25. Heat is carried horizontally by ----- (a) conduction
(b) erosion (c) transpersion (d) convection
(e) radiation.
- (-----) 26. The spring balance measures ----- (a) Volume
(b) mass (c) weight (d) ~~Area~~ Area of a body (e) density.
- () 27. The microphyle is present in ----- (a) spleen
(b) lungs (c) root (d) seed (e) flower.
- () 28. Spodium is kept in ----- (a) milk (b) alcohol water
(c) kerosene oil (d) turpentine
- () 29. Embryp is found inside a ----- (a) root (b) leaf
(c) branch (d) seed (e) stem.
- () 30. A Liquid differs from a solid in ----- (a) being
lighter (b) having no definite weight (c) having
no definite shape (d) moving easily downwards (e)
----- having no definite size.

COMPLETION TEST

Instructions:- In the following statements one word is omitted each =
(dash) indicates the omission of one word; write the missing word in the
space provided on the left hand side of each statement.

Example:- (Pistel) 1. Ovary is a part of -----

(Expands) 2. When iron is heated it -----

Similarly answer the following:-

- () 1. The lower fixed point of a Fahrenheit thermometer is ----- degrees.
- () 2. The compressibility of a body depends upon its -----.
- () 3. A fall in the mercury level of a barometer indicates a ----- in atmospheric pressure.
- () 4. Melting ice is a ----- change.
- () 5. Square yards is the unit of length in the ----- system.
- () 6. The space left between two railway lines because railway lines during summer.
- () 7. The apparatus used to transfer a small known volume of a liquid from one vessel to the other is called the -----.
- () 8. The tadpole breathes through its -----.
- () 9. Left auricle receives ----- blood.
- () 10. The lungs are the ----- organs in man.
- () 11. The white blood corpuscles are manufactured in the -----.
- () 12. The urinary system is found in the ----- cavity.
- () 13. A soil that yields a good crop is called a ----- soil.
- () 14. Butterfly belongs to a group of animals called -----.
- () 15. The caterpillar feeds up on the ----- of plants.
- () 16. The green colour present in the leaves is called -----.
- () 17. The green colouring matter in a leaves is called -----.

- () 19. The belly of the frog feels ----- rough touch.
- () 20. The tadpole feeds upon the leaves of ---- plants.
- () 21. Dissolving of sugar in water is an example -----
of change.
- () 22. Milk becoming curds is -----change.
- () 23. Animal charcoal is used in the -----industry.
- () 24. Hydrogen is collected over water because -----
- () 25. Water is a compound of hydrogen and -----
- () 26. A mixture of iron filing and sand can be
separated by using a -----

CLASSIFICATION TEST

Instructions:- Of the five items given below in each question, one item does not belong to that group as it does not agree with that group. Find out that item and write it in the space provided on the left hand side.

Example:- (Lung) Eye; Tongue; Nose; Lung ear.

Except lung the other four belong to the group of sensory organs.

Therefore the ~~xx~~ item lung has been written in the brackets.

Similarly answer the following:

- () 1. Ovary stamen, calyx, petals stomata.
- () 2. Nostrils, food pipe, wind pipe, larynx lungs.
- () 3. Ginger turmeric, onion, lotus, onion.
- () 4. Egg, larva, pupa, pupa, adult.
- () 5. Inferior vena cava, superior vena cava, pulmonary artery.

-) 6. Water milk, mercury soil oil.
-) 7. Foot in h. centimetre gram metre.
-) 8. Glass. brass wool. cotton wood.
-) 9. Steel copper glass diamond chalk.
-) 10 Glass stone cast iron brick steel.
-) 11. Water castor oil. milk. wire lime juice.
-) 12. Oxygen. magnesium Hydrogen. Nitrogen carbon-di-oxide.
-) 13. Potassium chloride potassium permanganate. red oxide of mercury. lead nitrate potassium chloride.
-) 14. Gas carbon graphite. soot. wood charcoal bone charcoal.
-) 15. Ice. butter. sulphur. camphor wax-
-) 16. Manganese dioxide potassium ~~chloride~~ chlorate. gun powder. iron sulphide. sodium hydroxide.
-) 17. Calcium chloride. sodium hydroxide. manganese chloride. ; potassium carbonate sodium carbonate.
-) 18. Seed. coat. anther. cetyledon plumule. radical.
-) 19. Flower. root. leaves. stem. branch.
-) 20. Carrot. radish. potato sweet potato dahila.
-) 21. Ink filler. syringe. thermometer cycle pump inflater.
-) 22. Eyes. heart. nose. ears. tongue.;
-) 23. Ductility. viscosity. malliability. tenacity. rigidity.
-) 24. Stomach. smell. viscosity malliability. tenacity. rigidity.
-) 25. ~~flax~~. Calyx. epicalyx. pedicel staminal tube bulb.

ANALOGIES TEST

Instructions:- Of the three items given below in each question there is a some relation between any two. Study the three words carefully and understand to relation ship of the two items. Find a forth which has the same relationship to the other 2 item. Write it in the space ~~mark~~ provided in the left hand side.

Examples:- (contract) Heat:- Expands:- Cold:.

Here is a relationship between 1 & 2 heat expands bodies similarly cold contracts bodies so the forth item is contracts. It should be written in the margin.

Similarly answer the following:-

Answer

- () 1. Convection: liquids:: conduction:.....
- () 2. Centigrade scale :100:: Fahrenheit
- () 3. Thermometer: Temperature:: Barometer.....
- () 4. 1 Centrimeter : 10 millimeter :: 1 foot.....
- () 5. Mass:Grams::Length:.....
- () 6. Madras:30" of barometer high:: Bangalore....
- () 7. Air:Wind pipe:: Food.....
- () 8. Peticle :flower:: Petrol.....
- () 9. Sepals:Calyx:: Petals.....
- () 10.Potato: tube::onion.....

- () 12. Cvale:Overy :: Pollen grandur.....
- () 13. Right Ventricle: Pulmonary artery::Left ventricle.....
- () 14. Blood: man: asp:.....
- () 15. Flumule:Radical::Shoot.....
- () 16. Plant: Seed::Bird.....
- () 17.Diamond:Charcoal::hard:.....
- () 18.Air:Water::Mixture:.....

MATCHING TEST

Instruction:- Two lists of words are given below in "A" one refers to the Scientific terms and the other refers to their values. Similarly there are two lists in "B" and "C" referring to the column match the terms and their values in "A" by writing in bracket on the left hand side of each term the number of its corresponding constants. Similarly write the number of the definite item in "B" and "C" in the bracket on the left hand side of its corresponding scientific terms.

<u>Sample:-</u>	() Substance	Color
	() Charcoal	1.White.
	() Copper	2.Black.
	() Milk	3.Red.

"A"

Scientific terms:-

- () height of mercury in a barometer at a sea level: 1) 212 F
- () melting point of ice: 2) 100 C
- () Higher fixed point of the Fahrenheit thermometer 3) 32°

- () Boiling point of water. 4) 98.6F
- () Normal temperature of the human body. 5) 98.6F

"C"

- () Tricuspid Valve 1. A small opening on one side of seed.
- () Filament. 2. The upper part of the primary axis.
- () Style. 3. The legs of the caterpillar.
- () Scales 4. The tube connecting the ovary and stigma.
- () Plumule 5. The colored covering on the wings of the butterfly.
- () Testa 6. The stalk of the stamens.
- () Microphyle 7. The valve between the L.A. and R.V.
- () Bi-cuspid valve. 8. The outer part of the seed.
- () Pseudo-pads. 9. The valve between the R.A. and R.V.

"C"

Column I

Column II

- () Density 1. Solid being drawn into thin wires.
- () Malleability 2. Solids being broken when hammered.
- () Brittleness 3. Mass per unit volume.
- () Density 4. Regarding original shape after the exact release of pressure.
- () Sublimation 5. Solids being beaten into thin sheets
- () Elasticity 6. One thousand c.c. of a liquid.
- () Litre. 7. One quantity of heat in a body.

ENUMERATION TEST

Instructions:- Answer the following questions by writing the words of the answers in the brackets below each question.

I. Name two chemicals used in the preparation of Oxygen in the Laboratory.

1. () 2. ()

II. State two important chemical properties of Oxygen.

1. () 2. ()

III. Mention any three important uses of oxygen.

1. () 2. ().

IV. Give two important uses of hydrogen.

1. () 2. ()

V. Mention four allotropic forms of carbon.

1. () 2. () 3. () 4. ().

VI. Name the three processes involved in the preparation of a mixture of common salt ammonium chloride and sand.

1. () 2. () 3. ()

VII. Name two uses of barometer.

1. () 2. () 3. ()

VIII. Mention two uses of a Brahma press.

1. () 2. ()

IX. Mention three reasons for using mercury in a barometer.

1. () 2. () 3. () 4. () 5. () 6. () 7. () 8. () 9. () 10. ()

7. A rod of iron held in fire does not burn where as a rod of wood burns why?

()

8. When salt dissolves in water the level of water does not rise why?

()

9. Why do we make use of a wire gauge while heating breakers and flashes in the laboratory?

()

10. Why does the butterfly lay eggs on the undersurface of the leaves.

()

11. Why does the tank frog come to the surface of water every now and then?

()

12. Which organ pumps blood to all parts of the body?

()

13. What do red corpuscles give the living cells?

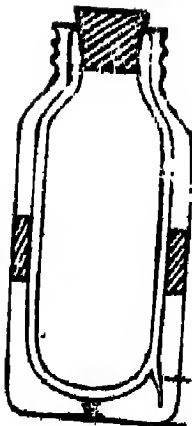

()

14. A jar of air is inverted over a jar of hydrogen. After some time a burning candle is introduced into the upper jar. what happens? why?

()

15. The temperature of a body is 122° What would it be in the centigrade scale?

DIAGRAM TEST

1. What does figure 1 represents ()
2. Why is "B" silvered on the inside ()
3. What is the inner bottle made ()

Figure.1.

PREPARATION OF OXYGEN

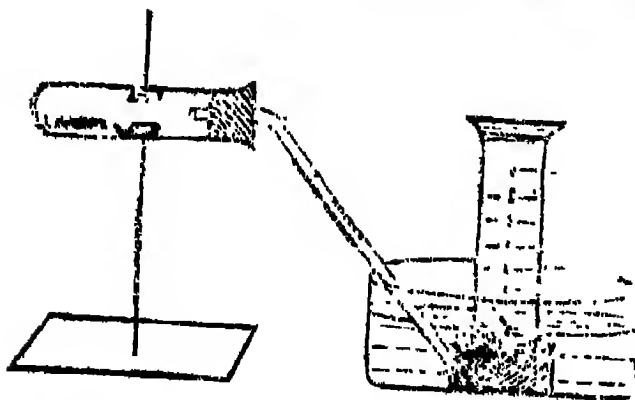

Figure.2.

1. What is omitted in this figure? ()
2. What substances are put in the test tube? ()
3. Which of the two substances gives off oxygen? ()
4. What is the name given to this method of collection of the gas? ()

Figure No.3.

In the given figure:

1. Name the part marked (1); (2); (3) & (4)

1() 2() 3() 4()

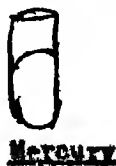

2. To which part of the body does part 1 carry blood? ()

3. To which part of the body does part 2 carry blood? ()

4. What kind of blood does part 2 carry? ()

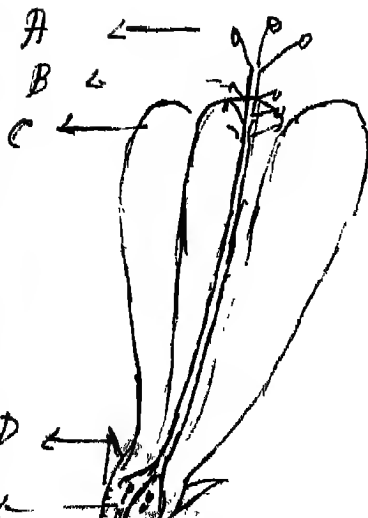

5. What kind of blood does the left auricle receive? ()

Figure No.4.

Which of the two given figures is wrong?
&
Why? ()

Figure No.5.

Name the parts marked

A. ()
B. ()
C. ()
D. ()
E. ()

Annual Income of Father or Guardian

INSTRUCTIONS

1. Fill in the above entries first.
 2. Read carefully the instructions given at the beginning of each test, understand them and then begin to answer.
 3. Answer these questions as quickly as you can.
 4. Do not answer the questions you do not know and those about which you are doubtful.
 5. If you cannot answer any question do not waste time. Pass on to the next question. You may answer the question left out, if there is time.
 6. Do not ask questions after you start answering.
-

True - False Test

Instructions :

Some of the following statements are true and some are false. The letters T and F are printed on the left hand side of each statement. Bracket the letter T if the statement is true. Bracket the letter F if the statement is false. Do not mark statements you do not know. Do not guess. Guessing reduces your score.

Example :

- (T) F 1. Sugar dissolves in water.
T (F) 2. Petals are green in colour.

Statement (1) is true. Therefore T is bracketted.

Statement (2) is false. Therefore F is bracketted.

Similarly answer the following :

- T F 1. Liquids find their own level in a communicating vessel.
T F 2. Graphite is an allotropic form of carbon.
~~T F~~ 3. *The mos flask is used to measure heat-*
T F 4. A hot glass chimney cracks when a drop of water falls on it.
T F 5. The wings of a butterfly are covered with scales.
T F 6. Burning of paper is a physical change.
T F 7. Atmospheric pressure depends upon the height of a place above sea level.
T F 8. Iodine melts when heated.
T F 9. Hydrogen is heavier than air.
T F 10. A body weighs more at the poles than at the equator.
T F 11. Hydrogen is a supporter of combustion.
T F 12. The part of air that supports life is nitrogen.
T F 13. Buds are found between primary and secondary roots.
T F 14. A mixture of common salt and sand can be separated by sublimation.
T F 15. Sodium is kept in water.
T F 16. Movements of the body are caused by muscles.
T F 17. White corpuscles are irregular in shape.
T F 18. Manganese dioxide is a catalytic agent.
T F 19. Calipers is used to measure the diameter of a cylinder.
T F 20. Right auricle receives pure blood.

Modified Form of True - False Test

Instructions :

Some of the following statements are true and some are false. The letters T and F are printed on the left hand side of each statement. If the statement is true bracket the letter T. If the statement is false bracket the letter F. In each statement one word is underlined. It is this word that makes the statement *true or false*. If a statement is false it can be made true by replacing the underlined word. Think of such a word and write it in the brackets provided on the left hand side of the statement.

Examples :

(T) F () 1. The unit of mass in the British system is Pound.

T F (porous) 2. Sponge absorbs water freely because it is elastic.

The first statement is true and so T is bracketted. There is no need to change the underlined word. The second statement is false. Sponge absorbs water because it is porous. Hence the word porous is written in the brackets.

Similarly answer the following :

T F () 1. Air is a mixture.

T F () 2. Hydrogen is a non-combustible gas.

T F () 3. In a chemical change one or more new substances are formed.

T F () 4. Priestley discovered oxygen.

T F () 5. The melting point of ice on the Fahrenheit scale is 32°.

T F () 6. The presence of earthworm in the soil is harmful to plants.

T F () 7. The mass of a body is measured by a thermometer.

T F () 8. Sodium carbonate is deliquescent.

T F () 9. Frog belongs to the group of vertebrates.

T F () 10. The unit of mass in the Metric system is ounce.

Multiple Choice Test

Instructions :

Here are some incomplete statements. They can be completed by only one of the five answers given. Select the correct answer and write its number in the brackets provided on the left hand side of each statement.

Examples :

(2) I. Stigma is a part of —

1. stomata, 2. pistil, 3. leaf, 4. stamen, 5. fruit.

(3) II. When red oxide of mercury is heated it gives off —

1. hydrogen, 2. nitrogen, 3. oxygen, 4. water vapour,
5. carbon dioxide.

In example I pistil is the correct word. So (2) is written in brackets. In example II oxygen is the correct word. Hence (3) is written in the brackets.

Similarly answer the following :

() I. A thermometer is used to measure —

1. weight, 2. height, 3. temperature, 4. volume,
5. pressure.

() II. Distillation is a method of —

1. pumping water, 2. transmitting heat, 3. exerting pressure,
4. purifying water, 5. measuring heat.

() III. The radicle is present in —

1. spleen, 2. lungs, 3. root, 4. flower,
5. seed.

() IV. Spring balance is used to measure —

1. volume, 2. weight, 3. area, 4. pressure,
5. mass.

() V. The butterfly has — pairs of legs :

1. two pairs, 2. three pairs, 3. four pairs.
4. five pairs, 5. six pairs.

() VI. Insoluble impurities in water are removed by —

1. crystallisation, 2. sublimation, 3. evaporation,
4. filtration, 5. distillation.

- () VII. The lower fixed point of a thermometer is —
1. the melting point of wax.
 2. the melting point of butter.
 3. the melting point of sulphur.
 4. the melting point of ice.
 5. the melting point of phosphorus.
- () VIII. When steam is passed over red hot iron — is given out.
1. oxygen, 2. nitrogen, 3. carbon dioxide,
 4. hydrogen, 5. sulphur dioxide.
- () IX. Combustion is another name for —
1. drying, 2. heating, 3. boiling,
 4. burning, 5. melting.
- () X. Heat is transmitted in solids by —
1. convection, 2. evaporation, 3. radiation,
 4. sublimation, 5. conduction.

Matching Test

Instructions :

Here are two columns of items. Each item in column A is related to some item in B. Find out the related item and write the serial number of that item in the space provided on the left hand side.

Example :

A	B
(2) Charcoal	1. White
(3) Copper	2. Black
(1) Milk	3. Red
	4. Yellow

Similarly answer the following :

A	B
() Litre.	1. 212°F
() Melting point of ice.	2. 76 inches.
() Higher fixed point of a Fahrenheit thermometer.	3. 30 inches.
() Height of a mercury barometer at sea-level.	4. 98.4°F

- | | |
|---|--|
| () Normal temperature of the human body. | 5. 0°C |
| () Tricuspid valve. | 6. 1000 c.c. |
| () Filament. | 7. Solids being beaten into thin sheets. |
| () Malleability. | 8. Mass per unit volume. |
| () Density. | 9. The door between the right auricle and the right ventricle. |
| () Sublimation. | 10. Solid directly becoming a gas when heated. |
| | 11. Stalk of stamen. |
| | 12. Quantity of heat in a body. |

Completion Test

Instructions :

In each of the following statements one word is omitted which is indicated by a — (dash). Write the missing word in the brackets on the left hand side of each statement.

Examples :

- (pistil) 1. Ovary is a part of — .
 (expands) 2. When iron is heated it — .

Similarly answer the following :

- () 1. The lower fixed point of a Fahrenheit thermometer is — degree.
 () 2. The caterpillar feeds upon the — of plants.
 () 3. The green colouring matter in a leaf is called — .
 () 4. Rusting of iron is an example of a — change.
 () 5. Yard is the unit of length in the — system.
 () 6. The left auricle receives — blood.
 () 7. Melting of ice is a — change.
 () 8. — is called Nature's ploughman.
 () 9. Butterfly sucks its food with the help of — .
 () 10. A mixture of iron filings and sulphur can be separated by using a — .

Classification Test

Instructions :

Of the items given below in each question one item does not belong to that group. Find out that item and write it in the brackets on the left hand side.

Examples :

- (Lung) 1. Eye, tongue, nose, lung, ear.
(Viscosity) 2. Viscosity, rigidity, ductility, malleability, tenacity.

In example No. 1, except lung the other four are sensory organs. Therefore the word lung has been written in the brackets. In example 2, except viscosity the other four are properties of solids. So viscosity is written in the brackets.

Similarly answer the following :

- () 1. Ovary, stamen, calyx, petal, stomata.
() 2. Water, milk, mercury, soil, oil.
() 3. Oxygen, carbon, sodium, magnesium, carbon dioxide.
() 4. Foot, inch, centimetre, gram, metre.
() 5. Flower, leaves, root, stem, branch.
() 6. Ink-filler, syringe, thermometer, cycle pump, foot-ball inflator.
() 7. Seed coat, anther, cotyledon, plumule, radicle.
() 8. Onion, flower, radish, cabbage, ginger.
() 9. Manganese dioxide, gun-power, iron sulphide, potassium chlorate, sodium hydroxide.
() 10. Liver, right auricle, right ventricle, left auricle, left ventricle.

Analogies Test

Instructions :

Of the three items given in each question, there is some relation between the first two. Understand the relationship of the first two items and find the fourth item which has the same relationship with the third and write it in the brackets on the left hand side.

Examples :

- (Contracts) 1. Heat : Expands :: Cold :
(Liquid) 2. Oxygen : Gas :: Water :

Heat expands bodies, similarly cold contracts bodies. Hence the word contracts is written in the brackets. In the second example oxygen is a gas, water is a liquid. So liquid is written in the brackets.

Similarly answer the following :

- | | | | | | | | | | |
|---|---|-----|---------------------|---|----------------|----|---------------------|---|-------|
| (|) | 1. | Convection | : | liquids | :: | Conduction | : | |
| (|) | 2. | Centigrade
scale | : | 100 | :: | Fahrenheit
scale | : | |
| (|) | 3. | Barometer | : | Pressure | :: | Thermometer | : | |
| (|) | 4. | 1 Centimetre | : | 10 Millimetres | :: | 1 Foot | : | |
| (|) | 5. | Air | : | Wind pipe | :: | Food | : | |
| (|) | 6. | Plumule | : | Shoot | :: | Radicle | : | |
| (|) | 7. | Potato | : | Tuber | :: | Onion | : | |
| (|) | 8. | Diamond | : | Hard | :: | Graphite | : | |
| (|) | 9. | Plant | : | Seed | :: | Bird | : | |
| (|) | 10. | Air | : | Mixture | :: | Water | : | |

Enumeration Test

Instructions :

Answer the following questions in the space provided below each question.

Examples :

1. Name the three main parts of the human body :
 1. Head,
 2. Trunk,
 3. Limbs.
2. Name the two elements contained in water :
 1. Oxygen,
 2. Hydrogen.

Answer the following similarly :

1. Name two chemicals used in the laboratory to prepare hydrogen :
- 1.
 - 2.

2. Name two important uses of oxygen :

8620 516 6A 79 2546 **1.**

2.

3. Name three allotropic forms of carbon :

1.

2.

3.

4. Mention two uses of a barometer :

1.

2.

5. Mention two uses of a Bramah Press :

1.

2.

6. Name three processes by which heat is transmitted :

1.

2.

3.

7. State three reasons for using mercury in the barometer :

1.

2.

3.

8. Name the three constituents of the soil :

1.

2.

3.

Diagrams Test

I.

1. What does this figure represent ?

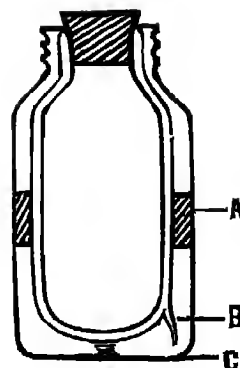

.....

2. Name the parts marked :

A.....

B.....

C.....

II. Preparation of oxygen in the laboratory :

1. What is omitted in this figure ?

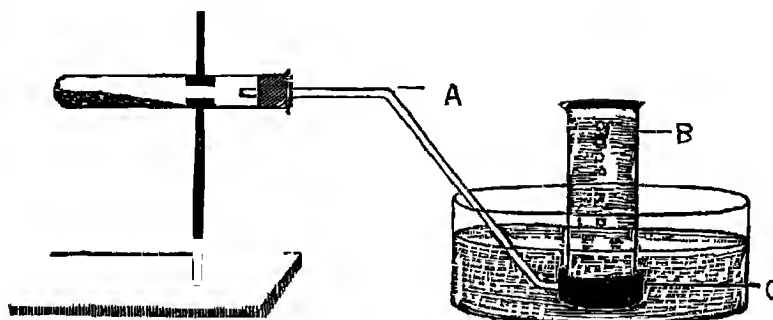

.....

2. Name the parts marked :

A.....

B.....

C.....

3. Name the two substances put in the test-tube :

(i)

(ii)

4. Which of these two substances gives off oxygen ?

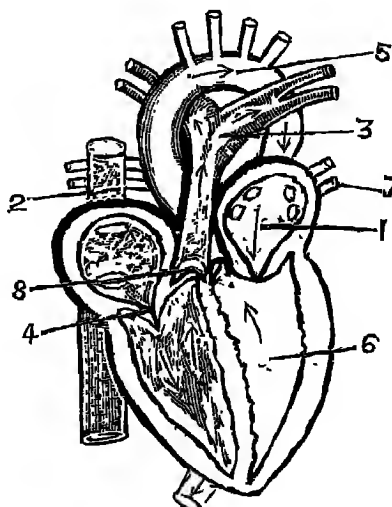

.....

5. In this case oxygen is collected by the.....displacement of water.

III. Longitudinal section of the Human heart :

In this sketch some important parts are numbered. Their names are written below. Find the number corresponding to each part and write it in the brackets provided :

Aorta ()
Left auricle ()
Tricuspid valve ()
Pulmonary artery ()
Semilunar valve ()
Superior vena cava ()
Pulmonary vein ()
Left ventricle ()

ಸರಿ - ತಪ್ಪು ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಈ ಕೆಳಗಿನ ಹೇಳಿಕೆಗಳಲ್ಲಿ ಕೆಲವು ಸರಿ, ಕೆಲವು ತಪ್ಪು. ಪ್ರತಿ ಹೇಳಿಕೆಯ ಎಡ ಭಾಗದಲ್ಲಿ, T ಮತ್ತು F ಎಂಬ ಎರಡು ಅಕ್ಷರಗಳನ್ನು ಮುದ್ರಿಸಲಾಗಿದೆ. ಹೇಳಿಕೆಯು ಸರಿಯಾಗಿದ್ದರೆ T ಎಂಬ ಅಕ್ಷರವನ್ನೂ, ತಪ್ಪಾಗಿದ್ದರೆ F ಎಂಬ ಅಕ್ಷರವನ್ನೂ ಅವರಣ(Bracket)ದಲ್ಲಿ ಸೇರಿಸಿ. ತಿಳಿಯದೆ ಇದ್ದ ಹೇಳಿಕೆಗಳನ್ನು ಗುರ್ತಿಸದೆ ಬಿಟ್ಟುಬಿಡಿ. ಊಹಿಸಿ ಗುರ್ತಿಸುವುದರಿಂದ ಅಂಕಗಳು ಕಡಿಮೆಯಾಗುತ್ತವೆ.

ಉದಾಹರಣೆ :

(T) F 1. ಸಕ್ಕರೆಯು ನೀರಿನಲ್ಲಿ ಕರಗುತ್ತದೆ.

T (F) 2. ದಳಗಳು ಬಣ್ಣದಲ್ಲಿ ಹಸುರಾಗಿರುತ್ತವೆ.

ಮೊದಲಿನ ಹೇಳಿಕೆಯು ಸರಿ. ಆದ್ದರಿಂದ T ಎಂಬ ಅಕ್ಷರಕ್ಕೆ ಅವರಣವನ್ನು ಹಾಕಿದೆ. ಎರಡನೆಯ ಹೇಳಿಕೆಯು ತಪ್ಪು. ಆದ್ದರಿಂದ F ಎಂಬ ಅಕ್ಷರಕ್ಕೆ ಅವರಣವನ್ನು ಹಾಕಿದೆ.

ಇದೇ ರೀತಿಯಲ್ಲಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- T F 1. ದ್ರವವಸ್ತುಗಳು ತಮ್ಮ ಮಟ್ಟವನ್ನು ತಾನೇ ಹುಡುಕಿಕೊಳ್ಳುತ್ತವೆ.
- T F 2. ಗ್ರಾಫೈಟ್, ಇಂಗಾಲದ ಒಂದು ಬಹುರೂಪ.
- T F 3. ಶಾಖವನ್ನು ಅಳಿಯಲು ಥರ್ಮೋಸ್ಟಾಟ್ ಉಪಯೋಗಿಸುತ್ತಾರೆ.
- T F 4. ಬಿಸಿ ಗಾಜಿನ ಚಮಚಿಯ ಮೇಲೆ ನೀರಿನ ತೊಟ್ಟು ಬಿದ್ದರೆ ಅದು ಒಡೆದುಹೋಗುತ್ತದೆ.
- T F 5. ಚಿಟ್ಟೆಯ ರಕ್ತೆಯ ಮೇಲೆಲ್ಲಾ ಹುರುಳಿಗಳಿರುವವು.
- T F 6. ಕಾಗದವು ಉರಿದಾಗ ಭಾತ ಬದಲಾವಣೆಯು ನಡೆಯುತ್ತದೆ.
- T F 7. ಸಮುದ್ರಮಟ್ಟದಿಂದ ಇರುವ ಎತ್ತರಕ್ಕೆ ಅನುಗುಣವಾಗಿ ಒಂದು ಸ್ಥಳದ ವಾಯುಸಂಮರ್ಧವು ಇರುತ್ತದೆ.
- T F 8. ಕಾಯಿಸಿದಾಗ ಆಯೋಡಿನ್ ಕರಗುತ್ತದೆ.
- T F 9. ಜಲಜನಕವು ಗಾಳಿಗಿಂತ ಭಾರ.
- T F 10. ಒಂದು ವಸ್ತುವಿನ ತೂಕವು ಭೂಮಾಕರ್ಷಣೀಯ ಬಲ ಇರುವುದಕ್ಕಿಂತ ಧ್ರುವಗಳ ಬಲ ಅಧಿಕ.
- T F 11. ಜಲಜನಕವು ದಹನಾನ್ವಿತವಾಗಿದೆ.
- T F 12. ಗಾಳಿಯ ಜೀವನಾಧಾರವಾದ ಭಾಗವು ಸಾರಜನಕ.
- T F 13. ತಾಯಿಬೇರು ಮತ್ತು ಕವಲುಬೇರುಗಳ ನಡುವೆ ಮೊಗ್ಗುಗಳು ಇರುತ್ತವೆ.
- T F 14. ಉತ್ಪತ್ತಿ ಕ್ರಮದಿಂದ ಮರಳು ಮತ್ತು ಅಡಿಗೆ ಉಪ್ಪುಗಳ ಮಿಶ್ರಣವನ್ನು ಬೇರ್ಪಡಿಸಬಹುದು.
- T F 15. ಸೋಡಿಯಂ ಅನ್ನು ನೀರಿನಲ್ಲಿ ಇಡುತ್ತಾರೆ.
- T F 16. ದೇಹದ ಚಲನೆಗಳು ಮಾಂಸಖಂಡಗಳಿಂದ ನಡೆಯುತ್ತವೆ.
- T F 17. ಬಿಳಿಯ ರಕ್ತಕಣಗಳಿಗೆ ಅನಿರ್ದಿಷ್ಟ ಆಕಾರವಿರುತ್ತದೆ.
- T F 18. ಮ್ಯಾಂಗನೀಸ್ ಡೈ ಆಕ್ಸೈಡ್ ಒಂದು ವೇಗವರ್ಧಕ.
- T F 19. ಜಾರುವ ಕ್ಯಾಲಿಪರ್‌ನ್ನು ತಿಲಿಂದರದ ವ್ಯಾಸವನ್ನಳೆಯಲು ಉಪಯೋಗಿಸುತ್ತಾರೆ.
- T F 20. ಬಲಹೃತ್ಪ್ರಕಾರಕ್ಕೆ ಶುದ್ಧ ರಕ್ತವು ಬರುತ್ತದೆ.

ರೂಪಾಂತರಗೊಳಿಸಿದ ಸರಿ - ತಪ್ಪು ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಈ ಕೆಳಗಿನ ಕೆಲವು ಹೇಳಿಕೆಗಳು ಸರಿ, ಕೆಲವು ತಪ್ಪು. ಪ್ರತಿ ಹೇಳಿಕೆಯ ಎಡದಲ್ಲಿ T ಮತ್ತು F ಎಂಬ ಅಕ್ಷರಗಳನ್ನು ಮುದ್ರಿಸಲಾಗಿದೆ. ಹೇಳಿಕೆಯು ಸರಿಯಾಗಿದ್ದರೆ T ಎಂಬ ಅಕ್ಷರಕ್ಕೆ ಅವರಣವನ್ನು ಹಾಕಿರಿ. ತಪ್ಪಾಗಿದ್ದರೆ F ಎಂಬ ಅಕ್ಷರಕ್ಕೆ ಅವರಣವನ್ನು ಗುರುತಿಸಿ. ಪ್ರತಿ ಹೇಳಿಕೆಯಲ್ಲಿಯೂ ಒಂದು ಪದದ ಕೆಳಗಡೆ ಗೆರೆಯನ್ನು ಎಳೆದಿದೆ. ಈ ಪದವೇ ಪ್ರತಿಹೇಳಿಕೆಯನ್ನೂ ಸರಿ ಅಥವಾ ತಪ್ಪಾಗುವಂತೆ ಮಾಡುತ್ತದೆ. ಹೇಳಿಕೆಯು ತಪ್ಪಾಗಿದ್ದರೆ ಹೀಗೆ ಗೆರೆ ಎಳೆದಿರುವ ಪದದ ಬದಲು ಬೇರೊಂದು ಪದವನ್ನು ಬರೆದು ಹೇಳಿಕೆಯನ್ನು ಸರಿಪಡಿಸಬಹುದು.

ಉದಾಹರಣೆ :

- (T) F () 1. ಬ್ರಿಟಿಷ್ ಪದ್ಧತಿಯಲ್ಲಿ ವಸ್ತುರಾಶಿಯ ಮೂಲಮಾನವು ಪೌಂಡ್.
- T (F) (ಸಚ್ಚಿದ್ರತೆ) 2. ಸ್ಪಂಜಿಗೆ ಸ್ಥಿತಿಸ್ಥಾಪಕ ಶಕ್ತಿ ಇರುವುದರಿಂದ ಅದು ನೀರನ್ನು ಹೀರಿಕೊಳ್ಳುತ್ತದೆ.

ಮೊದಲಿನ ಹೇಳಿಕೆಯು ಸರಿ. ಆದುದರಿಂದ T ಎಂಬ ಅಕ್ಷರಕ್ಕೆ ಅವರಣವನ್ನು ಎಳೆದಿದೆ. ಎರಡನೆಯದು ತಪ್ಪು. ಸ್ಪಂಜಿಗೆ ಸಚ್ಚಿದ್ರತೆ ಇರುವುದರಿಂದ ಅದು ನೀರನ್ನು ಹೀರಿಕೊಳ್ಳುತ್ತದೆ. ಆದ್ದರಿಂದ ಅವರಣದಲ್ಲಿ ಸಚ್ಚಿದ್ರತೆ ಎಂಬ ಪದವನ್ನು ಬರೆಯಲಾಗಿದೆ.

ಇದೇ ರೀತಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- T F () 1. ಗಾಳಿಯು ಒಂದು ಮಿಶ್ರಣ.
- T F () 2. ಜಲಜನಕವು ದಹ್ಯವಸ್ತುವಲ್ಲ.
- T F () 3. ರಸಾಯನಿಕ ಬದಲಾವಣೆಯಲ್ಲಿ ಒಂದು ಅಥವಾ ಹೆಚ್ಚು ಹೊಸ ವಸ್ತುಗಳು ಉತ್ಪತ್ತಿಯಾಗುತ್ತವೆ.
- T F () 4. ಜೋಸಫ್ ಪ್ರೀಸ್ಟ್ಲಿಯು ಅಮ್ಲಜನಕವನ್ನು ಕಂಡುಹಿಡಿದನು.
- T F () 5. ಫಾರಿನ್‌ಹೀಟ್ ಕ್ರಮದಲ್ಲಿ ಮಂಜುಗಡ್ಡೆಯ ಕರಗುವ ಬಿಂದುವು 32°.
- T F () 6. ಮಣ್ಣಿನಲ್ಲಿ ಎರೆಹುಳುಗಳ ಇರುವಿಕೆಯು ಸಸ್ಯಗಳಿಗೆ ಅಪಾಯಕಾರಿ.
- T F () 7. ಒಂದು ವಸ್ತುವಿನ ದ್ರವ್ಯರಾಶಿಯನ್ನು ಉಷ್ಣಮಾಪಿಯಿಂದ ಅಳೆಯುತ್ತಾರೆ.
- T F () 8. ಸೋಡಿಯಂ ಕಾರ್ಬೊನೇಟ್ ಜಲಾಕರ್ಷಕ ವಸ್ತು.
- T F () 9. ಕವ್ವೆಯು ಕಶೇರುಕ ವರ್ಗಕ್ಕೆ ಸೇರಿದ ಪ್ರಾಣಿ.
- T F () 10. ಮೆಟ್ರಿಕ್ ಪದ್ಧತಿಯಲ್ಲಿ ವಸ್ತುರಾಶಿಯ ಮೂಲಮಾನವು ಕೆಲೋಗ್ರಾಂ.

ಬಹುಶಃಗಳಿಂದ ಆಯ್ಕೆಯ ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಇಲ್ಲಿ ಕೆಲವು ಅಪೂರ್ಣ ಹೇಳಿಕೆಗಳನ್ನು ಕೊಟ್ಟಿದೆ. ಕೊಟ್ಟಿರುವ ಐದು ಉತ್ತರಗಳಲ್ಲಿ ಒಂದೇ ಒಂದರಿಂದ ಹೇಳಿಕೆಯನ್ನು ಪೂರ್ಣಗೊಳಿಸಬಹುದು. ಸರಿಯುತ್ವವನ್ನು ಚುನಾಯಿಸಿ ಮತ್ತು ಅದರ ಸಂಖ್ಯೆಯನ್ನು ಪ್ರತಿ ಹೇಳಿಕೆಯ ಎಡಗಡೆ ಕೊಟ್ಟಿರುವ ಅವರಣದಲ್ಲಿ ಬರೆಯಿರಿ.

ಉದಾಹರಣೆಗಳು :

- (2) I. ಶಲಾಕಾಗ್ರವು ಇದರ ಒಂದು ಭಾಗವಾಗಿದೆ.
 (1) ಪತ್ರರಂಧ್ರ, (2) ಶಲಾಕ, (3) ಎಲೆ, (4) ಪರಾಗ,
 (5) ಹಣ್ಣು.
- (3) II. ಕೆಂಪು ಪಾದರಸದ ಆಕ್ಸೈಡನ್ನು ಕಾಯಿಸಿದಾಗ ಈ ಅನಿಲವು ಬಿಡುಗಡೆಯಾಗುತ್ತದೆ.
 (1) ಜಲಜನಕ, (2) ಸಾರಜನಕ, (3) ಆಮ್ಲಜನಕ, (4) ನೀರಾವಿ,
 (5) ಇಂಗಾಲದ ಡೈ ಆಕ್ಸೈಡ್.

ಮೇಲಿನ ಮೊದಲಿನ ಉದಾಹರಣೆಯಲ್ಲಿ ಶಲಾಕ ಎಂಬುದು ಸರಿಯುತ್ವ. ಆದ್ದರಿಂದ ಅವರಣದಲ್ಲಿ 2 ಎಂದು ಗುರುತಿಸಿದೆ. ಎರಡನೆಯ ಉದಾಹರಣೆಯಲ್ಲಿ ಆಮ್ಲಜನಕ ಎಂಬುದು ಸರಿಯುತ್ವ. ಆದ್ದರಿಂದ ಅವರಣದಲ್ಲಿ 3 ಎಂದು ಗುರುತಿಸಿದೆ.

ಇದೇ ರೀತಿಯಲ್ಲಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- () I. —ನ್ನು ಅಳೆಯಲು ಉಷ್ಣಮಾಪಿಯನ್ನು ಉಪಯೋಗಿಸುತ್ತಾರೆ.
 (1) ತೂಕ, (2) ಎತ್ತರ, (3) ಉಷ್ಣತೆ, (4) ಗಾತ್ರ,
 (5) ಒತ್ತಡ.
- () II. ಭಟ್ಟಿ ಇಳಿಸುವಿಕೆಯು ಇಂತಹ ಒಂದು ವಿಧಾನ :
 (1) ನೀರನ್ನು ಎತ್ತುವುದು, (2) ಶಾಖಪ್ರಸಾರ, (3) ಸಂಮರ್ದವನ್ನು
 ಪಡೆಯುವುದು, (4) ನೀರನ್ನು ಶುದ್ಧಗೊಳಿಸುವುದು, (5) ಶಾಖವನ್ನು
 ಅಳೆಯುವುದು.
- () III. ಪ್ರಥಮ ಮೂಲವು — ಇದರಲ್ಲಿದೆ.
 (1) ಗುಳ್ಳೆ, (2) ಶ್ವಾಸಕೋಶ, (3) ಬೇರು, (4) ಹೂವು,
 (5) ಬೀಜ.
- () IV. —ನ್ನು ಅಳತೆಮಾಡಲು ಸ್ಟ್ರಿಂಗ್ ಕ್ರಾಸನ್ನು ಪಯೋಗಿಸುತ್ತಾರೆ.
 (1) ಗಾತ್ರ, (2) ತೂಕ, (3) ವಿಸ್ತೀರ್ಣ, (4) ಸಂಮರ್ದ,
 (5) ವಸ್ತುರಾಶಿ.
- () V. ಚಿಟ್ಟಿಗೆ—ಜೊತೆ ಕಾಲುಗಳಿವೆ.
 (1) ಎರಡು, (2) ಮೂರು, (3) ನಾಲ್ಕು, (4) ಐದು,
 (5) ಆರು.
- () VI. ದ್ರವದಲ್ಲಿನ ಕರಗದ ಕಶ್ಮಲ ವಸ್ತುಗಳನ್ನು—ಈ ಕ್ರಮದಿಂದ ಬೇರ್ಪಡಿಸುತ್ತೇವೆ.
 (1) ಹರಳು ಮಾಡುವಿಕೆ, (2) ಉತ್ಪತ್ತಿ, (3) ಇಂಗಿಸುವಿಕೆ,
 (4) ಶೋಧಿಸುವಿಕೆ, (5) ಭಟ್ಟಿ ಇಳಿಸುವಿಕೆ.

- () VII. ಉಷ್ಣ ಮಾಪಿಯ ಕೆಳಗಿನ ಆದರ್ಶಬಿಂದುವು—
 (1) ಮೇಣದ ಕರಗುವ ಬಿಂದು, (2) ಬೆಣ್ಣೆಯ ಕರಗುವ ಬಿಂದು,
 (3) ಗಂಧಕದ ಕರಗುವ ಬಿಂದು, (4) ಮಂಜುಗಡ್ಡೆಯ ಕರಗುವ ಬಿಂದು,
 (5) ರಂಜಕದ ಕರಗುವ ಬಿಂದು.
- () VIII. ಕೆಂಪಗೆ ಕಾಯಿಸಿದ ಕಬ್ಬಿಣದ ಮೇಲೆ ನೀರಾವಿಯನ್ನು ಹಾಯಿಸಿದಾಗ—ಉತ್ಪತ್ತಿ ಆಗುತ್ತದೆ.
 (1) ಆಮ್ಲಜನಕ, (2) ಸಾರಜನಕ, (3) ಇಂಗಾಲದ ಡೈ ಆಕ್ಸೈಡ್,
 (4) ಜಲಜನಕ, (5) ಗಂಧಕದ ಡೈ ಆಕ್ಸೈಡ್.
- () IX. —ಇದಕ್ಕೆ ಮತ್ತೊಂದು ಹೆಸರು ದಹನ ಎಂದು.
 (1) ಒಣಗುವಿಕೆ, (2) ಕಾಯಿಸುವಿಕೆ, (3) ಕುದಿಯುವಿಕೆ,
 (4) ಉರಿಯುವಿಕೆ, (5) ಕರಗುವಿಕೆ.
- () X. ಘನವಸ್ತುಗಳಲ್ಲಿ—ಕ್ರಮದಿಂದ ಶಾಖಪ್ರಸಾರವಾಗುತ್ತದೆ.
 (1) ಉಷ್ಣನಯನ, (2) ಆವಿಯಾಗುವಿಕೆ, (3) ರಕ್ತಿಪ್ರಸಾರ,
 (4) ಉತ್ಪತನ, (5) ಉಷ್ಣವಹನ.

ಜೋಡಣೆಯ ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಇಲ್ಲಿ ಕೊಟ್ಟಿರುವ A ಪಟ್ಟಿಯಲ್ಲಿನ ಪ್ರತಿಯೊಂದು ಅಂಶವೂ B ಪಟ್ಟಿಯಲ್ಲಿನ ಒಂದು ಅಂಶಕ್ಕೆ ಸಂಬಂಧ ಹೊಂದಿದೆ. ಅಂತಹ ಅಂಶವನ್ನು ಕಂಡುಹಿಡಿದು, ಅದರ ಸಂಖ್ಯೆಯನ್ನು ಎಡಗಡೆ-ಕೊಟ್ಟಿರುವ ಸ್ಥಳದಲ್ಲಿ ಬರೆಯಿರಿ.

ಉದಾಹರಣೆ :

	A ಪಟ್ಟಿ	B ಪಟ್ಟಿ
(2)	ಇದ್ದಿಲು	1. ಬಿಳುಪು
(3)	ತಾಮ್ರ	2. ಕಪ್ಪು
(1)	ಹಾಲು	3. ಕೆಂಪು
		4. ಹಳದಿ

ಇದೇ ರೀತಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

	A ಪಟ್ಟಿ	B ಪಟ್ಟಿ
()	ಲೀಟರ್	1. 212°F
()	ಮಂಜುಗಡ್ಡೆಯ ಕರಗುವ ಬಿಂದು	2. 76 ಅಂಗುಲಗಳು
()	ಫಾರಿನ್‌ಹೀಟ್ ಉಷ್ಣ ಮಾಪಿಯ ಮೇಲಿನ ಆದರ್ಶಬಿಂದು	3. 30 ಅಂಗುಲಗಳು
()	ಸಮುದ್ರಮಟ್ಟದಲ್ಲಿ ವಾಯುಭಾರಮಾಪಿಯಲ್ಲಿನ ಪಾದರಸದ ಮಟ್ಟ	4. 0°C
()	ಮಾನವ ಶರೀರದ ನಾರ್ಮಲ್ ಉಷ್ಣತೆ	5. ವಸ್ತುವಿನ ಶಾಖದ ಮೊತ್ತ.
()	ಟ್ರೈಕಸಾಪಿಡ್ ಕವಾಟಿ	6. 1000 ಘನ ಸೆಂಟಿಮೀಟರ್
()	ಪರಾಗ ದಂಡ	7. ಘನವಸ್ತುಗಳನ್ನು ತೆಳುವಾದ ತಗಡುಗಳಾಗಿ ಬಡಿಯುವುದು.
()	ಪತ್ರರೂಪಕ್ಷಮತ್ತು	8. ಮೂಲಮಾನ ಗಾತ್ರದಲ್ಲಿನ ವಸ್ತುಶಾಖೆ
()	ಸಾಂದ್ರತೆ	9. ಬಲ ಹೃತ್ಕರ್ಣ, ಹೃತ್ಕುಕ್ಷಿಗಳ ನಡುವಿನ ಕವಾಟಿ
()	ಉತ್ಪತನ	10. ಘನವಸ್ತುಗಳನ್ನು ಕಾಯಿಸಿದಾಗ ನೇರವಾಗಿ ಆವಿಯ ರೂಪಕ್ಕೆ ಬರುವಿಕೆ.
		11. ಕೇಸರದ ತೊಟ್ಟು
		12. 98.4°F

ಪೂರಕ ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಈ ಕೆಳಗಿನ ಪ್ರತಿ ಹೇಳಿಕೆಯಲ್ಲಿಯೂ ಒಂದು ಪದ ಬಿಟ್ಟುಹೋಗಿದೆ. ಇದನ್ನು ಒಂದು ಗೆರೆಯಿಂದ ಸೂಚಿಸಲಾಗಿದೆ. ಆ ಬಿಟ್ಟುಹೋದ ಪದವನ್ನು ಹೇಳಿಕೆಯ ಎಡಭಾಗದಲ್ಲಿರುವ ಆವರಣದಲ್ಲಿ ಬರೆಯಿರಿ.

ಉದಾಹರಣೆ :

- (ಅಂಡಾಶಯ) 1. ಅಂಡಕೋಶವು — ದ ಒಂದು ಭಾಗ.
(ವಿಕಾಸ) 2. ಕಬ್ಬಿಣವನ್ನು ಕಾಯಿಸಿದಾಗ ಅದು — ಗೊಳ್ಳುತ್ತದೆ.

ಇದೇ ರೀತಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- () 1. ಫಾರಿನ್‌ಹೀಟ್ ಉಷ್ಣ ಮಾಪಿಯ ಕೆಳಗಿನ ಆದರ್ಶಬಿಂದುವು — ಡಿಗ್ರಿಗಳು.
() 2. ಕಂಬಳಿಹುಳುವು ಸಸಿಗಳ — ನ್ನು ತಿನ್ನುತ್ತದೆ.
() 3. ಎಲೆಗಳಲ್ಲಿರುವ ಹಸುರು ವಸ್ತುವು — .
() 4. ಕಬ್ಬಿಣವು ತುಕ್ಕುಹಿಡಿಯುವುದು — ಬದಲಾವಣೆಗೆ ಉದಾಹರಣೆ.
() 5. — ಪದ್ಧತಿಯಲ್ಲಿ ಚದರ ಗಜವು ವಿಸ್ತೀರ್ಣದ ಮೂಲಮಾನ.
() 6. ಎಡ ಹೈಪರ್‌ಟ್ರೋಫಿ — ರಕ್ತವು ಬಂದು ಸೇರುತ್ತದೆ.
() 7. ಮಂಜುಗಡ್ಡೆಯ ಕರಗುವಿಕೆಯು — ಬದಲಾವಣೆ.
() 8. — ನ್ನು ಪ್ರಕೃತಿಯ ರೈತ ಎಂದು ಕರೆಯುತ್ತಾರೆ.
() 9. ಚಿಟ್ಟೆಯು ಹೊವಿನ ಮಕರಂದವನ್ನು — ನಿಂದ ಹೀರುತ್ತದೆ.
() 10. ಗಂಧಕ ಮತ್ತು ಕಬ್ಬಿಣದ ರಜಗಳ ಮಿಶ್ರಣವನ್ನು — ನ್ನು ಉಪಯೋಗಿಸಿ ಬೇರ್ಪಡಿಸಬಹುದು.

ವರ್ಗೀಕರಣ ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಈ ಕೆಳಗಿನ ಅಂಶಗಳಲ್ಲಿ ಒಂದು ಅಂಶವು ಮಾತ್ರ ಭಿನ್ನಗುಂಪಿಗೆ ಸೇರಿದೆ. ಉಳಿದವು ಒಂದೇ ಗುಂಪಿಗೆ ಸೇರಿವೆ. ವಿಭಿನ್ನ ಗುಂಪಿಗೆ ಸೇರಿದ ಆ ಪದವನ್ನು ಆವರಣದಲ್ಲಿನ ಜಾಗದಲ್ಲಿ ಬರೆಯಿರಿ.

ಉದಾಹರಣೆ :

- (ಶ್ವಾಸಕೋಶ) 1. ಕಣ್ಣು, ನಾಲಿಗೆ, ಮೂಗು, ಶ್ವಾಸಕೋಶ, ಕಿವಿ.
(ಸ್ನಿಗ್ಧತ್ವ) 2. ಸ್ನಿಗ್ಧತ್ವ, ದೃಢತ್ವ, ತಾಂತವತೆ, ಪತ್ರರೂಪಕ್ಷಮತ್ವ, ಧಾರಣಸಾಮರ್ಥ್ಯ.

ಮೊದಲಿನ ಉದಾಹರಣೆಯಲ್ಲಿ ಶ್ವಾಸಕೋಶವನ್ನು ಬಿಟ್ಟು ಉಳಿದ ನಾಲ್ಕು ಅಂಶಗಳೂ ಪಂಚೇಂದ್ರಿಯಗಳ ಗುಂಪಿಗೆ ಸೇರಿವೆ. ಆದ್ದರಿಂದ ಶ್ವಾಸಕೋಶ ಎಂಬ ಪದವನ್ನು ಆವರಣದಲ್ಲಿ ಬರೆದಿದೆ. ಎರಡನೆಯ ಉದಾಹರಣೆಯಲ್ಲಿ ಸ್ನಿಗ್ಧತ್ವವನ್ನು ಬಿಟ್ಟು ಉಳಿದವು ಘನವಸ್ತುವಿನ ಗುಣಗಳು. ಆದ್ದರಿಂದ ಆವರಣದಲ್ಲಿ ಸ್ನಿಗ್ಧತ್ವ ಎಂದು ಬರೆದಿದೆ.

ಇದೇ ರೀತಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- () 1. ಅಂಡಕೋಶ, ಕೇಸರ, ಪುಷ್ಪಪಾತ್ರ, ಪುಷ್ಪದಳ, ಪತ್ರರಂಧ್ರಗಳು.
- () 2. ನೀರು, ಹಾಲು, ಪಾದರಸ, ಮಣ್ಣು, ಎಣ್ಣೆ.
- () 3. ಆಮ್ಲಜನಕ, ಇಂಗಾಲ, ಸೋಡಿಯಂ, ಮ್ಯಾಗ್ನೀಷಿಯಂ, ಇಂಗಾಲದ ಡೈ ಆಕ್ಸೈಡ್.
- () 4. ಅಡಿ, ಅಂಗುಲ, ಸೆಂಟಿಮೀಟರ್, ಗ್ರಾಂ, ಮೀಟರ್.
- () 5. ಹೂವು, ಎಲೆಗಳು, ಬೇರು, ಕಾಂಡ, ಕೊಂಬೆ.
- () 6. ಮಸೀಪೂರಕ, ಪಿಚಕಾರಿ, ಉಷ್ಣಮಾಪಿ, ಸೈಕಲ್ ಪಂಪ್, ಫುಟ್‌ಬಾಲ್ ಪಂಪ್.
- () 7. ಬೀಜದ ಸಿವೆ, ಪರಾಗಕೋಶ, ಬೀಜದಳ, ಪ್ರಥಮ ಕಾಂಡ, ಪ್ರಥಮ ಮೂಲ.
- () 8. ಈರುಳ್ಳಿ, ಹೂವು, ಮೂಲಂಗಿ, ಕೋಸು, ಶುಂಠಿ.
- () 9. ಮ್ಯಾಂಗನೀಸ್ ಡೈ ಆಕ್ಸೈಡ್, ಮದ್ದಿನ ಪುಡಿ, ಕಬ್ಬಿಣದ ಸಲ್ಫೈಡ್, ಪೊಟಾಸಿಯಂ ಕ್ಲೋರೈಟ್, ಸೋಡಿಯಂ ಹೈಡ್ರಾಕ್ಸೈಡ್.
- () 10. ಯಕ್ಷತ್ತು, ಬಲ ಹೃತ್ಪರ್ಣ, ಬಲ ಹೃತ್ಪಕ್ಷಿ, ಎಡ ಹೃತ್ಪರ್ಣ, ಎಡ ಹೃತ್ಪಕ್ಷಿ.

ಸಂಬಂಧಕಲ್ಪನಾ ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳಲ್ಲಿನ ಮೊದಲಿನ ಎರಡು ಅಂಶಗಳಿಗೆ ಪರಸ್ಪರ ಸಂಬಂಧವಿದೆ. ಈ ಸಂಬಂಧವನ್ನು ಅರ್ಥಮಾಡಿಕೊಂಡು ಅದೇ ರೀತಿಯಲ್ಲಿ ಮೂರನೆಯ ಮತ್ತು ನಾಲ್ಕನೆಯ ಅಂಶಗಳಿಗೆ ಸಂಬಂಧ ಕಲ್ಪಿಸುವಂತೆ ನಾಲ್ಕನೆಯ ಅಂಶವನ್ನು ಕಂಡುಹಿಡಿದು ಅವರಣದಲ್ಲಿರುವ ಜಾಗದಲ್ಲಿ ಬರೆಯಿರಿ.

ಉದಾಹರಣೆ :

(ಸಂಕೋಚಗೊಳ್ಳುತ್ತದೆ) 1. ಶಾಖ : ವಿಕಾಸಹೊಂದುತ್ತದೆ :: ಶೈತ್ಯ : —

(ದ್ರವ) 2. ಆಮ್ಲಜನಕ : ಅನಿಲ :: ನೀರು : —

ಶಾಖದಿಂದ ವಸ್ತುಗಳು ವಿಕಾಸಹೊಂದುತ್ತವೆ; ಶೈತ್ಯದಿಂದ ಸಂಕೋಚಗೊಳ್ಳುತ್ತವೆ. ಆದ್ದರಿಂದ ಮೊದಲಿನ ಉದಾಹರಣೆಯಲ್ಲಿನ ಅವರಣದಲ್ಲಿ ಸಂಕೋಚಗೊಳ್ಳುತ್ತವೆ ಎಂದು ಬರೆದಿದೆ. ಆಮ್ಲಜನಕವು ಅನಿಲ, ನೀರು ದ್ರವ. ಆದ್ದರಿಂದ ಎರಡನೆಯ ಉದಾಹರಣೆಯಲ್ಲಿನ ಅವರಣದಲ್ಲಿ ದ್ರವ ಎಂದು ಬರೆದಿದೆ.

ಇದೇ ರೀತಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- () 1. ಉಷ್ಣನಯನ : ದ್ರವಗಳು :: ಉಷ್ಣವಹನ : —
- () 2. ಸೆಂಟಿಗ್ರೇಡ್ ಅಳತೆ : 100 :: ಫಾರಿನ್‌ಹೀಟ್ ಅಳತೆ : —
- () 3. ವಾಯುಭಾರಮಾಪಿ : ಸಂಮರ್ದ :: ಉಷ್ಣಮಾಪಿ : —
- () 4. 1 ಸೆಂಟಿಮೀಟರ್ : 10 ಮಿಲಿಮೀಟರ್ :: 1 ಅಡಿ : —
- () 5. ಗಾಳಿ : ಶ್ವಾಸನಾಳ :: ಅಹಾರ : —
- () 6. ಪ್ರಥಮ ಕಾಂಡ : ಕಾಂಡ :: ಪ್ರಥಮ ಮೂಲ : —

()	7. ಆಲೂಗೆಡ್ಡೆ	:	ಟ್ಯೂಬರ್	:	:	ಈರುಳ್ಳಿ	:	—
()	8. ವಜ್ರ	:	ಕಠಿಣ	:	:	ಗ್ರಾಫೈಟ್	:	—
()	9. ಗಡ	:	ಬೀಜ	:	:	ಪಕ್ಷಿ	:	—
()	10. ಗಾಳಿ	:	ಮಿಶ್ರಣ	:	:	ನೀರು	:	—

ಸಂಖ್ಯಾ ಪರೀಕ್ಷೆ

ಸೂಚನೆ—ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳಿಗೆ ಉತ್ತರವನ್ನು ಬಿಟ್ಟಿರುವ ಜಾಗಗಳಲ್ಲಿ ಬರೆಯಿರಿ.

ಉದಾಹರಣೆ :

- I. ಮನುಷ್ಯಶರೀರದ ಮೂರು ಮುಖ್ಯ ಭಾಗಗಳನ್ನು ತಿಳಿಸಿ :
(1) ರುಂಡ, (2) ಮುಂಡ, (3) ಕೈಕಾಲುಗಳು.

- II. ನೀರಿನಲ್ಲಿರುವ ಎರಡು ಮೂಲವಸ್ತುಗಳನ್ನು ತಿಳಿಸಿ :
(1) ಆಮ್ಲಜನಕ, (2) ಜಲಜನಕ.

ಇದೇ ರೀತಿ ಈ ಕೆಳಗಿನ ಪ್ರಶ್ನೆಗಳನ್ನು ಉತ್ತರಿಸಿ :

- ಜಲಜನಕವನ್ನು ಪ್ರಯೋಗಶಾಲೆಯಲ್ಲಿ ತಯಾರಿಸುವಾಗ ಉಪಯೋಗಿಸುವ ಎರಡು ರಸಾಯನಿಕ ವಸ್ತುಗಳನ್ನು ತಿಳಿಸಿ : (1) (2)
- ಆಮ್ಲಜನಕದ ಎರಡು ಮುಖ್ಯ ಉಪಯೋಗಗಳನ್ನು ತಿಳಿಸಿ :
(1)
(2)
- ಇಂಗಾಲದ ಮೂರು ಬಹುರೂಪಗಳನ್ನು ತಿಳಿಸಿ :
(1) (2) (3)
- ವಾಯುಭಾರಮಾಪಿಯ ಎರಡು ಉಪಯೋಗಗಳನ್ನು ತಿಳಿಸಿ :
(1)
(2)
- ಬ್ರಾಹ್ಮ ಮರ್ದನಯಂತ್ರದ ಎರಡು ಉಪಯೋಗಗಳನ್ನು ತಿಳಿಸಿ :
(1)
(2)
- ಶಾಖಪ್ರಸಾರವಾಗುವ ಮೂರು ಕ್ರಮಗಳನ್ನು ತಿಳಿಸಿ :
(1) (2) (3)
- ವಾಯುಭಾರಮಾಪಿಯಲ್ಲಿ ಪಾದರಸವನ್ನು ಉಪಯೋಗಿಸಲು ಮೂರು ಕಾರಣಗಳನ್ನು ತಿಳಿಸಿ :
(1)
(2)
(3)
- ಮಣ್ಣಿನ ಮೂರು ಭಾಗಗಳನ್ನು ತಿಳಿಸಿ :
(1)
(2)
(3)

ಚಿತ್ರ ಪರೀಕ್ಷೆ

I.

1. ಈ ಚಿತ್ರವು ಏನನ್ನು ಸೂಚಿಸುತ್ತದೆ ?

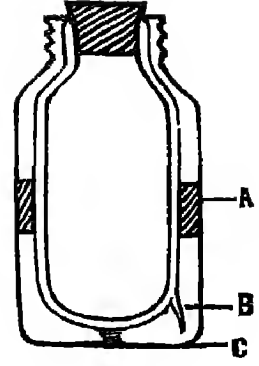

.....

2. ಇಲ್ಲಿ ಸೂಚಿಸಿರುವ ಭಾಗಗಳ ಹೆಸರನ್ನು ತಿಳಿಸಿ :

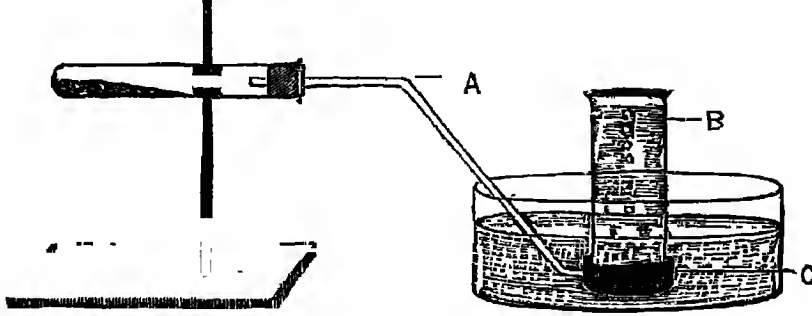

A.....

B.....

C.....

II. ಪ್ರಯೋಗಶಾಲೆಯಲ್ಲಿ ಆಮ್ಲ ಜನಕವನ್ನು ತಯಾರಿಸುವಿಕೆ :

1. ಚಿತ್ರದಲ್ಲಿ ಬಿಟ್ಟುಹೋಗಿರುವ ಭಾಗವು ಯಾವುದು ?

.....

2. ಗುರ್ತಿಸಿರುವ ಭಾಗಗಳ ಹೆಸರನ್ನು ತಿಳಿಸಿ :

A.....

B.....

C.....

3. ಪ್ರನಾಳದಲ್ಲಿ ಹಾಕುವ ಎರಡು ವಸ್ತುಗಳನ್ನು ತಿಳಿಸಿ :

(i)

(ii)

4. ಆ ಎರಡು ವಸ್ತುಗಳಲ್ಲಿ ಯಾವುದು ಆಮ್ಲ ಜನಕವನ್ನು ಕೊಡುತ್ತದೆ ?

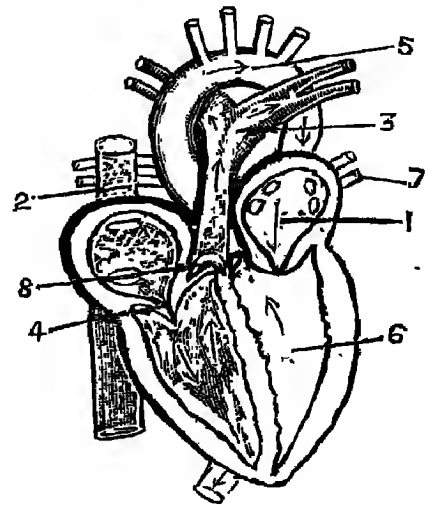

.....

5. ಈ ಸಂದರ್ಭದಲ್ಲಿ ಆಮ್ಲ ಜನಕವನ್ನು ನೀರಿನ.....ಮುಖ ಸ್ಥಾನಪಲ್ಲಟದಿಂದ ಶೇಖರಿಸುತ್ತೇವೆ.

III. ಮನುಷ್ಯನ ಹೃದಯದ ನೀಳಚ್ಛೇದ :

ಈ ಚಿತ್ರದಲ್ಲಿ ಕೆಲವು ಮುಖ್ಯ ಭಾಗಗಳನ್ನು ಸಂಖ್ಯೆಗಳಿಂದ ಗುರುತಿಸಿದೆ. ಅವುಗಳ ಹೆಸರುಗಳನ್ನು ಕೆಳಗೆ ಬರೆಯಲಾಗಿದೆ. ಪ್ರತಿ ಭಾಗಕ್ಕೂ ಅನುಗುಣವಾದ ಸಂಖ್ಯೆಯನ್ನು ಕಂಡುಹಿಡಿದು ಅವರಣದಲ್ಲಿನ ಜಾಗದಲ್ಲಿ ಬರೆಯಿರಿ.

Appendix E

C.Rangachar, B.Sc., M.Ed. (Leeds),
Principal

Teachers' College,
Mysore,
20th January 1961.

Sir/Madam,

Sri G.M.Khan Ghori, a Final Year M.Ed. student of this College has constructed an Achievement Test in 'General Science' for High School II Year class. To standardize this test, he wants to administer it to a group of students of your school as detailed below. At the same time, he requires the following information about each candidate to whom the test is administered in your school.

1. The test marks and the first terminal examination marks of the candidate in 'General Science'.
2. Name 10 best and 10 worst students regarding their Achievement in General Science as per the estimate of the subject teachers.

The number of candidates required for the test is:

Class: H.S. II Year:	Eng. Medium	Kan. Medium.	Total
----------------------	-------------	--------------	-------

The time required for the test is one hour. The date and time of administration of the Test:

A fairly spacious room or hall may be spared for conducting the test under examination conditions.

I request you kindly to cooperate in this educational endeavour and give Sri Khan Ghori all the necessary help and information for the successful conduct of the Test.

Thanking you,

yours faithfully,

(C.Rangachar)
Principal

To

The Head Master/Head Mistress,
..... High School,
.....
